Re: Canyon Fuel Company, LLC
Skyline Mines
ACT/005/007

Dear Mr. Haddock:

A spontaneous combustion fire has started in the coal stockpile at the minesite. Water is being sprayed in the area of the fire to cool the pile. The water running off of the pile has a burnt coal smell and has a red tint. All the water is reporting to the sediment pond. At the present time, the sediment pond is not discharging to Eccles Creek.

We would like permission to pump the sediment pond water underground to prevent the water with the burnt coal smell from entering Eccles Creek. We plan to pump the water down two feet below the overflow structure of the sediment pond. The pond will then be allowed to refill but before the pond will discharge the water level will again be reduced. We plan to follow this procedure for approximately two weeks. The water will be tested weekly to ensure that the it meets the effluent standards as required by our UPDES Permit. A sample of this water has already been obtained. The water will be pumped to an isolated area of the mine that will not discharge to the surface as requested by the U. S. Forest Service. This procedure is some what similar to the procedure used during operation of the slurry system.

Your prompt consideration and approval is greatly appreciated.

Sincerely,

Gary E. Taylor
Sr. Environmental Engineer
Canyon Fuel Company, LLC
Skyline Mines

This is approved on a one time only basis. Approval is conditioned on Canyon Fuel providing quantities of water pumped and a map or diagram showing the location where the water will be pumped.
