## Preservation Check Sheet

**Sample Set Extension and pH**

| Bottle Type | Preservative | All OK | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Ammonia | pH <2 $H_2SO_4$ | ✓ | | | | | | | | | | | | | | | |
| COD | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Cyanide | PH >12 NaOH | | | | | | | | | | | | | | | | |
| Metals | pH <2 $HNO_3$ | ✓ | | | | | | | | | | | | | | | |
| $NO_2$ & $NO_3$ | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Nutrients | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| O & G | pH <2 HCL | | | | | | | | | | | | | | | | |
| Phenols | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Sulfide | pH > 9NaOH, Zn Acetate | | | | | | | | | | | | | | | | |
| TKN | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| TOC | pH <2 $H_3PO_4$ | | | | | | | | | | | | | | | | |
| TOX | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| T $PO_4$ | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| TPH | pH <2 HCL | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |

Procedure:
1) Pour a small amount of sample in the sample lid
2) Pour sample from Lid gently over wide range pH paper
3) **Do Not** dip the pH paper in the sample bottle or lid
4) If sample is not preserved properly list its extension and receiving pH in the appropriate column above
5) Flag COC, notify client if requested
6) Place client conversation on COC
7) Samples may be adjusted

Frequency: All samples requiring preservation

RE: Scofield Baseline (Kinney #2)

Dear Brad Lindsay: Lab Set ID: 1102368

American West Analytical Laboratories received 4 sample(s) on 2/25/2011 for the analyses presented in the following report.

All analyses were performed in accordance to The NELAC Institute protocols unless noted otherwise. American West Analytical Laboratories is certified by The NELAC Institute in Utah and Texas; and is state certified in Colorado and Idaho. Certification document is available upon request. If you have any questions or concerns regarding this report please feel free to call.

The abbreviation "Surr" found in organic reports indicates a surrogate compound that is intentionally added by the laboratory to determine sample injection, extraction, and/or purging efficiency. The "Reporting Limit" found on the report is equivalent to the practical quantitaion limit (PQL). This is the minimum concentration that can be reported by the method referenced and the sample matrix. The reporting limit must not be confused with any regulatory limit. Analytical results are reported to three significant figures for quality control and calculation purposes.

Thank You,

Approved by: Kyle F. Gross — Digitally signed by Kyle F. Gross DN: cn=Kyle F. Gross, o=AWAL, ou=AWAL, email=kyle@awal-labs.com, c=US Date: 2011.03.08 14:40:09 -07'00'

Laboratory Director or designee

All analyses applicable to the CWA, SDWA, and RCRA are performed in accordance to NELAC protocols. Pertinent sampling information is located on the attached COC. This report is provided for the exclusive use of the addressee. Privileges of subsequent use of the name of this company or any member of its staff, or reproduction of this report in connection with the advertisement, promotion or sale of any product or process, or in connection with the re-publication of this report for any purpose other than for the addressee will be granted only on contact. This company accepts no responsibility except for the due performance of inspection and/or analysis in good faith and according to the rules of the trade and of science.

## Preservation Check Sheet

### Sample Set Extension and pH

| Bottle Type | Preservative | All OK | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Ammonia | pH <2 $H_2SO_4$ | ✓ | | | | | | | | | | | | | | | |
| COD | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Cyanide | PH >12 NaOH | | | | | | | | | | | | | | | | |
| Metals | pH <2 $HNO_3$ | ✓ | | | | | | | | | | | | | | | |
| $NO_2$ & $NO_3$ | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Nutrients | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| O & G | pH <2 HCL | ✓ | | | | | | | | | | | | | | | |
| Phenols | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Sulfide | pH > 9NaOH, Zn Acetate | | | | | | | | | | | | | | | | |
| TKN | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| TOC | pH <2 $H_3PO_4$ | | | | | | | | | | | | | | | | |
| TOX | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| T $PO_4$ | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| TPH | pH <2 HCL | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |

Procedure:
1) Pour a small amount of sample in the sample lid
2) Pour sample from Lid gently over wide range pH paper
3) **Do Not** dip the pH paper in the sample bottle or lid
4) If sample is not preserved properly list its extension and receiving pH in the appropriate column above
5) Flag COC, notify client if requested
6) Place client conversation on COC
7) Samples may be adjusted

Frequency: All samples requiring preservation

RE: Scofield Baseline (Kinney 1 & 2)

Dear Brad Lindsay: Lab Set ID: 1104009

American West Analytical Laboratories received 2 sample(s) on 4/1/2011 for the analyses presented in the following report.

All analyses were performed in accordance to The NELAC Institute protocols unless noted otherwise. American West Analytical Laboratories is certified by The NELAC Institute in Utah and Texas; and is state certified in Colorado and Idaho. Certification document is available upon request. If you have any questions or concerns regarding this report please feel free to call.

The abbreviation "Surr" found in organic reports indicates a surrogate compound that is intentionally added by the laboratory to determine sample injection, extraction, and/or purging efficiency. The "Reporting Limit" found on the report is equivalent to the practical quantitaion limit (PQL). This is the minimum concentration that can be reported by the method referenced and the sample matrix. The reporting limit must not be confused with any regulatory limit. Analytical results are reported to three significant figures for quality control and calculation purposes.

Thank You,

Approved by: Kyle F. Gross Digitally signed by Kyle F. Gross DN: cn=Kyle F. Gross, o=AWAL, ou=AWAL, email=kyle@awal-labs.com, c=US Date: 2011.04.14 13:56:19 -06'00'

Laboratory Director or designee

All analyses applicable to the CWA, SDWA, and RCRA are performed in accordance to NELAC protocols. Pertinent sampling information is located on the attached COC. This report is provided for the exclusive use of the addressee. Privileges of subsequent use of the name of this company or any member of its staff, or reproduction of this report in connection with the advertisement, promotion or sale of any product or process, or in connection with the re-publication of this report for any purpose other than for the addressee will be granted only on contact. This company accepts no responsibility except for the due performance of inspection and/or analysis in good faith and according to the rules of the trade and of science.

| Ammonia | pH <2 $H_2SO_4$ | ✓ | | | | | | | | | | | | | | | |
| COD | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Cyanide | PH >12 NaOH | | | | | | | | | | | | | | | | |
| Metals | pH <2 $HNO_3$ | ✓ | | | | | | | | | | | | | | | |
| $NO_2$ & $NO_3$ | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Nutrients | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| O & G | pH <2 HCL | | | | | | | | | | | | | | | | |
| Phenols | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Sulfide | pH > 9NaOH, Zn Acetate | | | | | | | | | | | | | | | | |
| TKN | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| TOC | pH <2 $H_3PO_4$ | | | | | | | | | | | | | | | | |
| TOX | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| T $PO_4$ | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| TPH | pH <2 HCL | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |

Procedure:

1) Pour a small amount of sample in the sample lid
2) Pour sample from Lid gently over wide range pH paper
3) **Do Not** dip the pH paper in the sample bottle or lid
4) If sample is not preserved properly list its extension and receiving pH in the appropriate column above
5) Flag COC, notify client if requested
6) Place client conversation on COC
7) Samples may be adjusted

Frequency: All samples requiring preservation

RE: Scofield Baseline / Kinney #2

Dear Brad Lindsay: Lab Set ID: 1104515

American West Analytical Laboratories received 2 sample(s) on 4/29/2011 for the analyses presented in the following report.

All analyses were performed in accordance to The NELAC Institute protocols unless noted otherwise. American West Analytical Laboratories is certified by The NELAC Institute in Utah and Texas; and is state certified in Colorado and Idaho. Certification document is available upon request. If you have any questions or concerns regarding this report please feel free to call.

The abbreviation "Surr" found in organic reports indicates a surrogate compound that is intentionally added by the laboratory to determine sample injection, extraction, and/or purging efficiency. The "Reporting Limit" found on the report is equivalent to the practical quantitaion limit (PQL). This is the minimum concentration that can be reported by the method referenced and the sample matrix. The reporting limit must not be confused with any regulatory limit. Analytical results are reported to three significant figures for quality control and calculation purposes.

Thank You,

Approved by: Kyle F. Gross

Laboratory Director or designee

All analyses applicable to the CWA, SDWA, and RCRA are performed in accordance to NELAC protocols. Pertinent sampling information is located on the attached COC. This report is provided for the exclusive use of the addressee. Privileges of subsequent use of the name of this company or any member of its staff, or reproduction of this report in connection with the advertisement, promotion or sale of any product or process, or in connection with the re-publication of this report for any purpose other than for the addressee will be granted only on contact. This company accepts no responsibility except for the due performance of inspection and/or analysis in good faith and according to the rules of the trade and of science.

## Preservation Check Sheet

**Sample Set Extension and pH**

| Bottle Type | Preservative | All OK | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Ammonia | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| COD | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Cyanide | PH >12 NaOH | | | | | | | | | | | | | | | | |
| Metals | pH <2 $HNO_3$ | ✓ | | | | | | | | | | | | | | | |
| $NO_2$ & $NO_3$ | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Nutrients | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| O & G | pH <2 HCL | | | | | | | | | | | | | | | | |
| Phenols | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Sulfide | pH > 9NaOH, Zn Acetate | | | | | | | | | | | | | | | | |
| TKN | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| TOC | pH <2 $H_3PO_4$ | | | | | | | | | | | | | | | | |
| TOX | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| T $PO_4$ | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| TPH | pH <2 HCL | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |

Procedure:
1) Pour a small amount of sample in the sample lid
2) Pour sample from Lid gently over wide range pH paper
3) **Do Not** dip the pH paper in the sample bottle or lid
4) If sample is not preserved properly list its extension and receiving pH in the appropriate column above
5) Flag COC, notify client if requested
6) Place client conversation on COC
7) Samples may be adjusted

Frequency: All samples requiring preservation

RE: Kinny #2 Mine

Dear Brad Lindsay: Lab Set ID: 1106636

American West Analytical Laboratories received 5 sample(s) on 6/30/2011 for the analyses presented in the following report.

All analyses were performed in accordance to The NELAC Institute protocols unless noted otherwise. American West Analytical Laboratories is certified by The NELAC Institute in Utah and Texas; and is state certified in Colorado and Idaho. Certification document is available upon request. If you have any questions or concerns regarding this report please feel free to call.

The abbreviation "Surr" found in organic reports indicates a surrogate compound that is intentionally added by the laboratory to determine sample injection, extraction, and/or purging efficiency. The "Reporting Limit" found on the report is equivalent to the practical quantitaion limit (PQL). This is the minimum concentration that can be reported by the method referenced and the sample matrix. The reporting limit must not be confused with any regulatory limit. Analytical results are reported to three significant figures for quality control and calculation purposes.

Thank You,

## WORK ORDER Summary

**Work Order:** 1106636
Page 1 of 5 7/7/2011

**Client:** Carbon Resources
**Client ID:** CAR300 **Contact:** Brad Lindsay
**Project:** Kinny #2 Mine **QC Level:** LEVEL II+ **WO Type:** Project
**Comments:** No Hard Copies. QC 2+, EDD/ Not enough volume received to do Total Settleable Solids, client was notified and he cancelled that for this time. Also, limited volume for NH3 & Total Phos, share!;

| TPH | pH <2 HCL | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |

Procedure:
1) Pour a small amount of sample in the sample lid
2) Pour sample from Lid gently over wide range pH paper
3) **Do Not** dip the pH paper in the sample bottle or lid
4) If sample is not preserved properly list its extension and receiving pH in the appropriate column above
5) Flag COC, notify client if requested
6) Place client conversation on COC
7) Samples may be adjusted

Frequency: All samples requiring preservation

RE: Scofield Baseline - (Kinney Mine)

Dear Brad Lindsay: Lab Set ID: 1110160

American West Analytical Laboratories received 9 sample(s) on 10/11/2011 for the analyses presented in the following report.

All analyses were performed in accordance to The NELAC Institute protocols unless noted otherwise. American West Analytical Laboratories is certified by The NELAC Institute in Utah and Texas; and is state certified in Colorado, Idaho, and Missouri. Certification document is available upon request. If you have any questions or concerns regarding this report please feel free to call.

The abbreviation "Surr" found in organic reports indicates a surrogate compound that is intentionally added by the laboratory to determine sample injection, extraction, and/or purging efficiency. The "Reporting Limit" found on the report is equivalent to the practical quantitation limit (PQL). This is the minimum concentration that can be reported by the method referenced and the sample matrix. The reporting limit must not be confused with any regulatory limit. Analytical results are reported to three significant figures for quality control and calculation purposes.

Thank You,

Approved by: Kyle F. Gross — Digitally signed by Kyle F. Gross DN: cn=Kyle F. Gross, o=AWAL, ou=AWAL, email=kyle@awal-labs.com, c=US Date: 2011.10.19 13:50:47 -06'00'

Laboratory Director or designee

All analyses applicable to the CWA, SDWA, and RCRA are performed in accordance to NELAC protocols. Pertinent sampling information is located on the attached COC. This report is provided for the exclusive use of the addressee. Privileges of subsequent use of the name of this company or any member of its staff, or reproduction of this report in connection with the advertisement, promotion or sale of any product or process, or in connection with the re-publication of this report for any purpose other than for the addressee will be granted only on contact. This company accepts no responsibility except for the due performance of inspection and/or analysis in good faith and according to the rules of the trade and of science.

| PRINT NAME: Tyler Michael Berry | Time: 2:00pm | PRINT NAME: Elena Hayslett | Time: 1400 |
| | | | |
| | | | |
| | | | |

Special Instructions:
* spoke with Greg Hunt concerning missing sampling containers. Cancel Settleable solids for #4, 7, 8
Cancel OGs for #4 & #8.
eh

TABLE 4

Utah Division of Oil, Gas & Mining
Ground Water Monitoring Requirements
Baseline, Operational and Post-mining

| | | | | | REPORTED AS |
|---|---|---|---|---|---|
| | | | FIELD MEASUREMENTS | | |
| | * | - | Water level or Flow | | Depth, Flow |
| 1 L HDPE | * | - | pH | | Standard units |
| 1 L HDPE | * | - | Specific Conductivity | | umhos/cm @ 25° C |
| 250 mL HDPE | * | - | Temperature | | °C |
| 1 500 mL HNO3 | | | | | |
| 1 250 mL H2SO4 | | | | | |
| | | | LABORATORY MEASUREMENTS | | |
| | * | - | Total Dissolved Solids | | mg/l |
| | * | - | Total Hardness ($CaCO_3$) | | mg/l |
| | * | - | Total Alkalinity | | mg/l |
| | | - | Acidity | | mg/l |
| | | - | Aluminum (Dissolved) | | mg/l |
| | | - | Arsenic (Dissolved) | | mg/l |
| | | - | Boron (Dissolved)[1] | | mg/l |
| | * | - | Carbonate | | mg/l |
| | * | - | Bicarbonate | | mg/l |
| | | - | Cadmium (Dissolved) | | mg/l |
| | * | - | Calcium (Dissolved) | | mg/l |
| | * | - | Chloride | | mg/l |
| | | - | Copper (Dissolved) | | mg/l |
| | * | - | Iron (Dissolved) | | mg/l |
| | * | - | Iron (Total) | | mg/l |
| | | - | Lead (Dissolved) | mg/l | |
| | * | - | Magnesium (Dissolved) | | mg/l |
| | * | - | Manganese (Dissolved) | | mg/l |
| | * | - | Manganese (Total) | | mg/l |
| | | - | Molybdenum (Dissolved) | | mg/l |
| | | - | Ammonia | | mg/l |
| | | - | Nitrates | | mg/l |
| | | - | Nitrites | | mg/l |
| | * | - | Potassium (Dissolved) | | mg/l |
| | | - | ~~Phosphate (Ortho)~~ | | mg/l Changed to Total Phosphate per Greg Hunt 6/30/11 RW |
| | | - | Selenium[1] (Dissolved) | | mg/l |
| | * | - | Sodium (Dissolved) | | mg/l |
| | * | - | Sulfate | | mg/l |
| | | - | Zinc (Dissolved) | mg/l | |
| | * | - | Cations | | meq/l |
| | * | - | Anions | | meq/l |

[1] These parameters will be analyzed in the baseline for all sites and included as operational at waste rock sites only.
\- Indicates parameters required for Baseline monitoring.
* Indicates parameters required for Operational and Post-mining monitoring unless amended as per section 5E above.

| TPH | pH <2 HCL | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |

Procedure:
1) Pour a small amount of sample in the sample lid
2) Pour sample from Lid gently over wide range pH paper
3) **Do Not** dip the pH paper in the sample bottle or lid
4) If sample is not preserved properly list its extension and receiving pH in the appropriate column above
5) Flag COC, notify client if requested
6) Place client conversation on COC
7) Samples may be adjusted

Frequency: All samples requiring preservation

RE: Kinney Mine

Dear Brad Lindsay: Lab Set ID: 1110268

American West Analytical Laboratories received 14 sample(s) on 10/13/2011 for the analyses presented in the following report.

All analyses were performed in accordance to The NELAC Institute protocols unless noted otherwise. American West Analytical Laboratories is certified by The NELAC Institute in Utah and Texas; and is state certified in Colorado, Idaho, and Missouri. Certification document is available upon request. If you have any questions or concerns regarding this report please feel free to call.

The abbreviation "Surr" found in organic reports indicates a surrogate compound that is intentionally added by the laboratory to determine sample injection, extraction, and/or purging efficiency. The "Reporting Limit" found on the report is equivalent to the practical quantitation limit (PQL). This is the minimum concentration that can be reported by the method referenced and the sample matrix. The reporting limit must not be confused with any regulatory limit. Analytical results are reported to three significant figures for quality control and calculation purposes.

Thank You,

Approved by: Kyle F. Gross

| Sulfide | pH > 9NaOH, Zn Acetate | | | | | | | | | | | | | | | | |
| TKN | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| TOC | pH <2 $H_3PO_4$ | | | | | | | | | | | | | | | | |
| TOX | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| T $PO_4$ | pH <2 $H_2SO_4$ | ✓ | | | | | | | | | | | | | | | |
| TPH | pH <2 HCL | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |

Procedure:
1) Pour a small amount of sample in the sample lid
2) Pour sample from Lid gently over wide range pH paper
3) **Do Not** dip the pH paper in the sample bottle or lid
4) If sample is not preserved properly list its extension and receiving pH in the appropriate column above
5) Flag COC, notify client if requested
6) Place client conversation on COC
7) Samples may be adjusted

Frequency: All samples requiring preservation

RE: Scofield Baseline

Dear Brad Lindsay: Lab Set ID: 1110390

American West Analytical Laboratories received 6 sample(s) on 10/20/2011 for the analyses presented in the following report.

All analyses were performed in accordance to The NELAC Institute protocols unless noted otherwise. American West Analytical Laboratories is certified by The NELAC Institute in Utah and Texas; and is state certified in Colorado, Idaho, and Missouri. Certification document is available upon request. If you have any questions or concerns regarding this report please feel free to call.

The abbreviation "Surr" found in organic reports indicates a surrogate compound that is intentionally added by the laboratory to determine sample injection, extraction, and/or purging efficiency. The "Reporting Limit" found on the report is equivalent to the practical quantitation limit (PQL). This is the minimum concentration that can be reported by the method referenced and the sample matrix. The reporting limit must not be confused with any regulatory limit. Analytical results are reported to three significant figures for quality control and calculation purposes.

Thank You,

## Preservation Check Sheet

### Sample Set Extension and pH

| Bottle Type | Preservative | All OK | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Ammonia | pH <2 $H_2SO_4$ | ✓ | | | | | | | | | | | | | | | |
| COD | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Cyanide | PH >12 NaOH | | | | | | | | | | | | | | | | |
| Metals | pH <2 $HNO_3$ | ✓ | | | | | | | | | | | | | | | |
| $NO_2$ & $NO_3$ | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Nutrients | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| O & G | pH <2 HCL | ✓ | | | | | | | | | | | | | | | |
| Phenols | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Sulfide | pH > 9NaOH, Zn Acetate | | | | | | | | | | | | | | | | |
| TKN | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| TOC | pH <2 $H_3PO_4$ | | | | | | | | | | | | | | | | |
| TOX | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| T $PO_4$ | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| TPH | pH <2 HCL | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |

Procedure:
1) Pour a small amount of sample in the sample lid
2) Pour sample from Lid gently over wide range pH paper
3) **Do Not** dip the pH paper in the sample bottle or lid
4) If sample is not preserved properly list its extension and receiving pH in the appropriate column above
5) Flag COC, notify client if requested
6) Place client conversation on COC
7) Samples may be adjusted

Frequency: All samples requiring preservation

RE: Kinney Baseline

Dear Brad Lindsay: Lab Set ID: 1110422

American West Analytical Laboratories received 7 sample(s) on 10/24/2011 for the analyses presented in the following report.

All analyses were performed in accordance to The NELAC Institute protocols unless noted otherwise. American West Analytical Laboratories is certified by The NELAC Institute in Utah and Texas; and is state certified in Colorado, Idaho, and Missouri. Certification document is available upon request. If you have any questions or concerns regarding this report please feel free to call.

The abbreviation "Surr" found in organic reports indicates a surrogate compound that is intentionally added by the laboratory to determine sample injection, extraction, and/or purging efficiency. The "Reporting Limit" found on the report is equivalent to the practical quantitation limit (PQL). This is the minimum concentration that can be reported by the method referenced and the sample matrix. The reporting limit must not be confused with any regulatory limit. Analytical results are reported to three significant figures for quality control and calculation purposes.

Thank You,

| | * - | Manganese (Dissolved) | | mg/l |
| | * - | Manganese (Total) | | mg/l |
| | - | ~~Molybdenum (Dissolved)~~ | | ~~mg/l~~ |
| | - | Ammonia | | mg/l |
| | - | Nitrates | | mg/l |
| | - | Nitrites | | mg/l |
| | * - | Potassium (Dissolved) | | mg/l |
| | - | ~~Phosphates(Ortho)~~ | | ~~mg/l~~ Changed to Total Phosphate per Greg Hunt 8/20/01 RKS |
| | - | Selenium[1] (Dissolved) | | mg/l |
| | * - | Sodium (Dissolved) | | mg/l |
| | * - | Sulfate | | mg/l |
| | - | Zinc (Dissolved) | mg/l | |
| | * - | Oil & Grease[2] | | mg/l |
| | * - | Cations | | meq/l |
| | * - | Anions | | meq/l |

1 Parameters will be analyzed for baseline at all sites and included as operational at waste rock sites.
2 O&G to be collected above and below mine sites.
\- Parameters required for Baseline monitoring.
* Parameters required for Operational and Post-mining monitoring unless amended as per section 5E above.

Changed to Total Phosphate per Greg Hunt 5/30/97 RAS

1 These parameters will be analyzed in the baseline for all sites and included as operational at waste rock sites only.
\- Indicates parameters required for Baseline monitoring.
* Indicates parameters required for Operational and Post-mining monitoring unless amended as per section 5E above.

Sample Set: 1110422

## Preservation Check Sheet

### Sample Set Extension and pH

| Bottle Type | Preservative | All OK | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Ammonia | pH <2 $H_2SO_4$ | ✓ | | | | | | | | | | | | | | | |
| COD | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Cyanide | PH >12 NaOH | | | | | | | | | | | | | | | | |
| Metals | pH <2 $HNO_3$ | ✓ | | | | | | | | | | | | | | | |
| $NO_2$ & $NO_3$ | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Nutrients | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| O & G | pH <2 HCL | ✓ | | | | | | | | | | | | | | | |
| Phenols | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Sulfide | pH > 9NaOH, Zn Acetate | | | | | | | | | | | | | | | | |
| TKN | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| TOC | pH <2 $H_3PO_4$ | | | | | | | | | | | | | | | | |
| TOX | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| T $PO_4$ | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| TPH | pH <2 HCL | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |

Procedure:
1) Pour a small amount of sample in the sample lid
2) Pour sample from Lid gently over wide range pH paper
3) **Do Not** dip the pH paper in the sample bottle or lid
4) If sample is not preserved properly list its extension and receiving pH in the appropriate column above
5) Flag COC, notify client if requested
6) Place client conversation on COC
7) Samples may be adjusted

Frequency: All samples requiring preservation

RE: Kinney #2 Mine

Dear Brad Lindsay: Lab Set ID: 1110506

American West Analytical Laboratories received 2 sample(s) on 10/25/2011 for the analyses presented in the following report.

All analyses were performed in accordance to The NELAC Institute protocols unless noted otherwise. American West Analytical Laboratories is certified by The NELAC Institute in Utah and Texas; and is state certified in Colorado, Idaho, and Missouri. Certification document is available upon request. If you have any questions or concerns regarding this report please feel free to call.

The abbreviation "Surr" found in organic reports indicates a surrogate compound that is intentionally added by the laboratory to determine sample injection, extraction, and/or purging efficiency. The "Reporting Limit" found on the report is equivalent to the practical quantitation limit (PQL). This is the minimum concentration that can be reported by the method referenced and the sample matrix. The reporting limit must not be confused with any regulatory limit. Analytical results are reported to three significant figures for quality control and calculation purposes.

Thank You,

Approved by: Kyle F. Gross

| | * | - | Cations | | meq/l |
| | * | - | Anions | | meq/l |

[1] These parameters will be analyzed in the baseline for all sites and included as operational at waste rock sites only.
\- Indicates parameters required for Baseline monitoring.
* Indicates parameters required for Operational and Post-mining monitoring unless amended as per section 5E above.

Sample Set: 1110506

## Preservation Check Sheet

**Sample Set Extension and pH**

| Bottle Type | Preservative | All OK | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Ammonia | pH <2 $H_2SO_4$ | ✓ | | | | | | | | | | | | | | | |
| COD | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Cyanide | PH >12 NaOH | | | | | | | | | | | | | | | | |
| Metals | pH <2 $HNO_3$ | ✓ | | | | | | | | | | | | | | | |
| $NO_2$ & $NO_3$ | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Nutrients | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| O & G | pH <2 HCL | | | | | | | | | | | | | | | | |
| Phenols | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Sulfide | pH > 9NaOH, Zn Acetate | | | | | | | | | | | | | | | | |
| TKN | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| TOC | pH <2 $H_3PO_4$ | | | | | | | | | | | | | | | | |
| TOX | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| T $PO_4$ | pH <2 $H_2SO_4$ | ✓ | | | | | | | | | | | | | | | |
| TPH | pH <2 HCL | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |

Procedure:
1) Pour a small amount of sample in the sample lid
2) Pour sample from Lid gently over wide range pH paper
3) **Do Not** dip the pH paper in the sample bottle or lid
4) If sample is not preserved properly list its extension and receiving pH in the appropriate column above
5) Flag COC, notify client if requested
6) Place client conversation on COC
7) Samples may be adjusted

Frequency: All samples requiring preservation

RE: Scofield Baseline (Kinney)

Dear Brad Lindsay: Lab Set ID: 1012038

American West Analytical Laboratories received 5 sample(s) on 12/2/2010 for the analyses presented in the following report.

All analyses were performed in accordance to The NELAC Institute protocols unless noted otherwise. American West Analytical Laboratories is certified by The NELAC Institute in Utah and Texas; and is state certified in Colorado and Idaho. Certification document is available upon request. If you have any questions or concerns regarding this report please feel free to call.

The abbreviation "Surr" found in organic reports indicates a surrogate compound that is intentionally added by the laboratory to determine sample injection, extraction, and/or purging efficiency. The "Reporting Limit" found on the report is equivalent to the practical quantitaion limit (PQL). This is the minimum concentration that can be reported by the method referenced and the sample matrix. The reporting limit must not be confused with any regulatory limit. Analytical results are reported to three significant figures for quality control and calculation purposes.

Thank You,

Approved by: Jose G. Rocha

PLEASE FILTER

TABLE 4

1 L HDPE
1 L HDPE
250 mL HDPE
500 mL HNO3
250 mL H2SO4

Utah Division of Oil, Gas & Mining
Surface Water Monitoring Recommendations
Baseline, Operational and Post-mining

| | | FIELD MEASUREMENTS | REPORTED AS |
|---|---|---|---|
| * | - | Water level or Flow | Depth, Flow |
| * | - | pH | Standard units |
| * | - | Specific Conductivity | umhos/cm @ 25° C |
| * | - | Temperature | °C |

LABORATORY MEASUREMENTS

| | | | |
|---|---|---|---|
| * | - | Total Dissolved Solids | mg/l |
| * | - | Total Hardness ($CaCO_3$) | mg/l |
| * | - | Total Alkalinity | mg/l |
| | - | Acidity | mg/l |
| | - | Aluminum (Dissolved) | mg/l |
| | - | Arsenic (Dissolved) | mg/l |
| | - | Boron (Dissolved)[1] | mg/l |
| * | - | Carbonate | mg/l |
| * | - | Bicarbonate | mg/l |
| | - | Cadmium (Dissolved) | mg/l |
| * | - | Calcium (Dissolved) | mg/l |
| * | - | Chloride | mg/l |
| | - | Copper (Dissolved) | mg/l |
| * | - | Iron (Dissolved) | mg/l |
| * | - | Iron (Total) | mg/l |
| | - | Lead (Dissolved) | mg/l |
| * | - | Magnesium (Dissolved) | mg/l |
| * | - | Manganese (Dissolved) | mg/l |
| * | - | Manganese (Total) | mg/l |
| | - | Molybdenum (Dissolved) | mg/l |
| | - | Ammonia | mg/l |
| | - | Nitrates | mg/l |
| | - | Nitrites | mg/l |
| * | - | Potassium (Dissolved) | mg/l |
| | - | Phosphate (Ortho) | mg/l |
| | - | Selenium[1] (Dissolved) | mg/l |
| * | - | Sodium (Dissolved) | mg/l |
| * | - | Sulfate | mg/l |
| | - | Zinc (Dissolved) | mg/l |
| * | - | Cations | meq/l |
| * | - | Anions | meq/l |

[1] These parameters should be analyzed in the baseline for all sites and included as operational at waste rock sites only.
\- Indicates parameters recommended for Baseline monitoring.
* Indicates parameters recommended for Operational and Post-mining monitoring unless amended as per section 5E above.

TABLE 3

½ gallon HDPE
1 L HDPE
1 L HDPE
1 500 mL HNO3
1 250 mL H2SO4
1 amber L HCL

Utah Division of Oil, Gas & Mining
Surface Water Monitoring Recommendations
Baseline, Operational and Post-mining

| | | FIELD MEASUREMENTS | REPORTED AS |

| * | - | Cations | meq/l |
| * | - | Anions | meq/l |

[1] Parameters should be analyzed for baseline at all sites and included as operational at waste rock sites.
[2] O&G to be collected above and below mine sites.
\- Parameters recommended for Baseline monitoring.
* Parameters recommended for Operational and Post-mining monitoring unless amended as per section 5E above.

½ gallon HDPE

Sample Set: 1012038

## Preservation Check Sheet

### Sample Set Extension and pH

| Bottle Type | Preservative | All OK | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except | Except |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Ammonia | pH <2 $H_2SO_4$ | ✓ | | | | | | | | | | | | | | | |
| COD | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Cyanide | PH >12 NaOH | | | | | | | | | | | | | | | | |
| Metals | pH <2 $HNO_3$ | ✓ | | | | | | | | | | | | | | | |
| $NO_2$ & $NO_3$ | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Nutrients | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| O & G | pH <2 HCL | ✓ | | | | | | | | | | | | | | | |
| Phenols | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| Sulfide | pH > 9NaOH, Zn Acetate | | | | | | | | | | | | | | | | |
| TKN | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| TOC | pH <2 $H_3PO_4$ | | | | | | | | | | | | | | | | |
| TOX | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| T $PO_4$ | pH <2 $H_2SO_4$ | | | | | | | | | | | | | | | | |
| TPH | pH <2 HCL | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | |

Procedure:
1) Pour a small amount of sample in the sample lid
2) Pour sample from Lid gently over wide range pH paper
3) **Do Not** dip the pH paper in the sample bottle or lid
4) If sample is not preserved properly list its extension and receiving pH in the appropriate column above
5) Flag COC, notify client if requested
6) Place client conversation on COC
7) Samples may be adjusted

Frequency: All samples requiring preservation

# Geotechnical Investigations

## RB&G Response to Comment R645-301-242.110 and R645-301-553.130

***The comment states:***

'……No specific recommendations for fill slopes were made, except that the sandy lean clay soils are collapsible and have a friction angle of 20 degrees…..'

***The reviewer is referred to the second paragraph of Page 17, which reads:***

'It is anticipated that fill slopes will be created with on-site material. If this material is placed and compacted in accordance with recommendations provided in Section IV, fill slopes as steep as 1.5H:1V will have a factor of safety of at least 1.3 if constructed of the native clayey soils. Fill slopes shown on Sections A-A, B-B, and F-F will likely be constructed of this clayey on-site fill. Test pits in the vicinity of the fill areas shown on Sections C-C, D-D, and E-E encountered significant amounts of medium-dense silty sand. Fill slopes as steep as 1.8H:1V constructed of this silty sand material have a computed factor of safety of at least 1.3. Plots of stability analyses for typical fill slopes are included in the appendix.'

Note that the Direct Shear test on the sample of sandy lean clay which had a friction angle of 20 degrees also had cohesion of 15 psi. Two Triaxial Shear tests performed on samples of the lean clay had total stress friction angles of 29.6 and 32.5 degrees with 2 psi cohesion and effective stress friction angles of 36.0 and 36.7 degrees with 2 psi cohesion.

## RB&G Response to Comment R645-301-534.130 and R645-301-121.200

***The comment states:***

'The Applicant must address the safety factor for roads within the text of the MRP.'

Recommendations provided in Section VI. SLOPE STABILITY of the Geotechnical Report are applicable to roadway cut and fills.

## RB&G Response to Comment R645-301-533.100 and 533.110

***The comment states:***

'The Applicant did not specifically state the safety factor for Sediment Pond 1.'

See Addendum No. 1 to the Geotechnical Report, attached hereto.

RB&G ENGINEERING, INC.

# KINNEY MINE
## Scofield, Utah

***Geotechnical Investigation***
*November 26, 2007*

## ADDENDUM NO. 1
*September 28, 2010*

***Add the following to the end of Section VI. SLOPE STABILITY***

Stability analyses were performed for the proposed Detention Pond for both Steady State and Sudden Drawdown conditions. The below ground pond was modeled with cut slopes of 3 horizontal to 1 vertical, extending 15 feet below the existing ground surface. It was assumed that the foundation soils will consist of native lean sandy clay. If fill is encountered in the excavation, it has been assumed that the cut will be over-excavated a distance of at least 10 feet into the side slope, and that this zone will be replaced with engineered fill as recommended in *Section V.I. – Detention Pond*. For the sudden drawdown condition, the phreatic surface was modeled to be within one foot of the slope surface 10 feet down-slope of the crest, exiting at the toe of the slope after full drawdown.

A factor of safety of 3.37 was obtained for the Steady State condition. For the Sudden Drawdown condition, the factor of safety reduces to 2.30.

If fill is encountered in the excavation, it has been assumed that the cut will be over-excavated a distance of at least 10 feet into the side slope, and that this zone will be replaced with engineered fill as recommended in *Section V.I. – Detention Pond*. For the sudden drawdown condition, the phreatic surface was modeled to be within one foot of the slope surface 10 feet down-slope of the crest, exiting at the toe of the slope after full drawdown.

A factor of safety of 3.37 was obtained for the Steady State condition. For the Sudden Drawdown condition, the factor of safety reduces to 2.30.

Subject: Kinney Mine, Scofield, Utah
Geotechnical Investigation

Gentlemen:

A Geotechnical Investigation has been completed for the proposed Kinney Mine in Scofield, Utah. The results of the study are summarized in the report transmitted herewith.

We appreciate the opportunity of providing this service for you. If there are any questions relating to the information contained herein, please call.

Sincerely,

RB&G ENGINEERING, INC.

***Geotechnical Investigation***

## INTRODUCTION

This report outlines the results of a geotechnical investigation performed for the proposed Kinney Mine surface facilities to be located north-northeast of Scofield, Utah at the approximate location shown in Figure 1. The purpose of this investigation was to determine the characteristics of the subsurface material throughout the site so that satisfactory substructures and slopes can be designed to support the proposed facilities. The results of the investigation, along with pertinent recommendations for design, are outlined in the following sections of this report.

The information contained in the report is discussed under the following headings: (1) Geologic Setting and Existing Site Conditions, (2) Field and Laboratory Testing Procedures, (3) Subsurface Soil and Water Conditions, (4) Site Preparation and Compacted Fill Requirements, (5) Foundation Considerations and Recommendations, and (6) Slope Stability Analyses.

## I. GEOLOGIC SETTING AND EXISTING SITE CONDITIONS

The regional and site geology is being prepared by others and will be submitted under separate cover. The area is located in Seismic Zone 2B according to the 1997 edition of the Uniform Building Code. The site is located on the east side of Highway 96, rising to the east with the elevation ranging from about 7700 to 7900 feet. Adjacent to Highway 96, the southerly half of the site is relatively flat for a few hundred feet before rising to the east. This area has been used for mining activities in the past and has been reclaimed with topsoil overlying approximately 2 to 6 feet of coal and soil fill. The vegetative cover across the site consists of native grass and sagebrush with some aspen trees.

Scofield Reservoir is located 0.5 to 1 mile northwest of the site at about elevation 7620 feet. No major water conveyance facilities or other water bodies exist in the immediate vicinity, which would influence the groundwater level at this site. Other than the information provided above, no conditions appear to exist at this site which would adversely affect foundation performance.

## II. FIELD AND LABORATORY TESTING PROCEDURES

The subsurface investigation was performed with borings and test pits. The borings were drilled using a Simco 2800 drill rig and continuous flight auger to advance the boring, and a Longyear 44 with H.Q. core to advance the boring. Where coring was performed in overburden, split spoon samples were obtained at select intervals. Sampling was generally performed in the overburden at five-foot intervals throughout the depth investigated. Disturbed samples were obtained by driving a 2-inch split spoon sampling tube through a distance of 18 inches using a 140-pound weight dropped from a distance of 30 inches. The number of blows to drive the sampling spoon through each 6 inches of penetration is shown on the boring logs. The sum of the last two blow counts, which represents the number of blows to drive the sampling spoon through 12 inches, is defined as the standard penetration value. The standard penetration value, corrected for overburden and hammer energy, provides a good indication of the in-place density of sandy material; however, it only provides an indication of the relative stiffness of the cohesive material, since the penetration resistance of materials of this type is a function of the moisture content. Considerable care must be exercised in interpreting the standard penetration value in gravelly-type soils, particularly where the size of the granular particle exceeds the inside diameter of the sampling spoon. If the spoon can be driven through the full 18 inches with a reasonable core recovery, the standard penetration value provides a good indication of the in-place density of gravelly-type material.

It will be noted that it was not possible to drive the sampling spoon through the full 18 inches at some sampling locations. Where the sampling tube could not be driven through the full 18 inches, the number of blows to drive the spoon through a given depth of penetration is shown on the boring logs.

Miniature vane shear tests, which provide an indication of the undrained shearing strength of cohesive materials, were performed on samples of the clay soil during the field investigations. The results of these tests are shown on the boring logs as the torvane value in tsf.

The test pits were excavated using a John Deere 160 trackhoe. During the subsurface investigation, the test pits were logged and sampling was performed at about three-foot intervals throughout the depth investigated. Both disturbed and undisturbed samples were obtained during the field investigations. The in-place dry unit weight and the natural moisture content was determined in the field using a Troxler nuclear density gauge at select sample locations with the samples delivered to the laboratory to verify moisture content. Undisturbed samples were obtained by trimming block samples of the cohesive material encountered in the soil profile.

Each sample obtained in the field was classified in the laboratory according to the Modified Unified Soil Classification System. The symbol designating the soil type according to this system, is presented on the logs. A description of the Modified Unified Soil Classification System is presented in the appendix, and the meaning of the various symbols, shown on the logs, can be obtained from this figure.

Laboratory tests performed during this investigation to define the characteristics of the subsurface material throughout the proposed site included in-place dry unit weight, natural moisture content, Atterberg Limits, mechanical analyses, unconfined compressive strength, pH, resistivity, sulfate, direct shear, triaxial shear, and consolidation tests. Testing was performed following procedures outlined in the American Society for Testing and Materials (ASTM) standards.

## III. SUBSURFACE SOIL AND WATER CONDITIONS

The characteristics of the subsurface material throughout the site were evaluated by drilling 6 borings to depths of between 25 and 76.5 feet and excavating 14 test pits to depths of between 8 and 19.5 feet at the approximate locations shown in Figure 2. The logs for the borings and test pits are presented in the appendix and the subsurface profile at each test hole location is included on the logs. Also included in the appendix are photos of the cores obtained in the borings.

No groundwater was encountered within the depth investigated at the time the field investigation was performed (August/September 2007).

The results of classification, density and moisture tests are presented on the test hole logs, and the results of all laboratory tests, with exception of the consolidation tests, are summarized in Tables 1 and 2 in the appendix. It will be noted from Table 1 that the in-place dry unit weight of the subsurface material varies from 86.6 to 118.5 pcf and that the natural moisture content of the cohesive soil ranges from 4.5 to 17.5%. The cohesive soil has 15 to 34% gravel, 19 to 42% sand, and 27 to 66% clay. The liquid limit of the lean clay and silt ranges from 19 to 42 and the plasticity index varies from 4 to 26. The non-plastic silty sand has 15 to 38% gravel size particles, 38 to 61% sand, and 9 to 28% silt. The gravelly material has 55 to 64% gravel, 23% sand, and 13 to 22% silt size particles. The unconfined compressive strength of the lean clay ranges from 2080 to 8280 psf.

One direct shear test was performed on a sample of the sandy lean clay obtained from Test Pit CV-5-1 at a depth of 12 feet. The results of this test are included in the appendix and summarized on Table 2. It will be noted that this sample has a friction angle of 20 degrees and a cohesion of 15 psi.

Two triaxial shear tests were performed on samples of the lean clay obtained from Boring CV-4-1 at a depth of 20 to 21.5 feet and from Boring SC-2 at 23 to 24 feet. The results of this test are also included in the appendix and summarized on Table 2. It will be observed that a friction angle of 29.6 and 32.5 degrees with 2 psi cohesion was obtained for the total stress envelopes.

In order to obtain an indication of the corrosive nature of the subsurface material at this site, four resistivity, pH, and sulfate tests were performed on samples obtained throughout the site. The results of these tests are presented on Table 2. It will be noted that the soils tested have relatively low corrosive characteristics. It is recommended that Type II cement be used for concrete in contact with soil.

The compressibility characteristics of the subsurface material were evaluated by performing eleven consolidation tests, and the results of these tests are also presented in the appendix. During the performance of the consolidation tests, each sample was loaded at the natural moisture content until a load intensity of 0.58 tsf had been reached. At this point in the loading cycle, each sample was permitted to absorb water without any increase in the load intensity. Soils having collapsible characteristics always settle without any increase in the load when they become wet or saturated, and expansive soils experience an increase in void ratio on absorbing water. It will be observed from these tests that five of the samples tested exhibited collapsible characteristics and that three of the samples showed expansive characteristics.

## IV. SITE PREPARATION AND COMPACTED FILL REQUIREMENTS

Included on Figure 2 are the location of preliminary cut and fill sections. These sections are presented in Figures 3 through 8. In areas where structures will be located, it is recommended that clearing and grubbing be performed to remove excess organic matter. It is anticipated that this will require stripping of the upper 6 inches and grubbing of tree and sagebrush roots. This action should also be performed in parking areas and borrow areas. Where cut and fill operations will take place, it is recommended that the excavated material be moisture conditioned to within 2% of optimum moisture content, placed in 8 inch (maximum) lifts and compacted to an in-place unit weight equal to at least 92% of the maximum laboratory density as determined by ASTM D 1557 for fills outside of building areas and 95% for fills where structures will be located. A sheeps-foot or tamping-type roller should be used for compacting the clay soils.

## V. FOUNDATION CONSIDERATIONS AND RECOMMENDATIONS

It is recommended that exterior structural foundations be located at a depth below finished grade sufficient to provide frost protection, which is about 4.5 feet in this area. If the foundations for

the proposed facilities are designed in accordance with the recommendations outlined below, the maximum settlement of any footing should not exceed one inch and differential settlement throughout the structure should not exceed 0.5 inch. It is generally recognized that the tolerable differential settlement for steel and concrete structures is about 0.002 times the column spacing. This criterion is tantamount to a differential settlement of about 0.5 inch for column spacings of 20 feet and 0.7 inch for column spacings of 30 feet. Since it is not anticipated that the column spacing for this structure will be less than 20 feet, a differential settlement of 0.5 inch should be satisfactory for the proposed facility. Additional potential settlement associated with collapsible type soil layers is discussed where applicable.

## A. MINE DRY / OFFICE – (Test Pits MDF-1, MDF-2, & MDF-3)

Test Pits MDF-1, 2 and 3 define the characteristics of the subsurface profile in the vicinity of the Mine Dry / Office facility. It will be noted from the test pit logs that the soil profile for Test Pit MDF-1 consists of stiff lean clay throughout the depth investigated (15 feet). Test Pit MDF-2 encountered clayey sand with gravel and silty sand with gravel, cobbles and boulders to a depth of 9 feet, followed by stiff lean clay to a depth of 18 feet. Test Pit MDF-3 encountered 3 feet of coal fill, followed by silty sand and gravel with cobbles and boulders to a depth of 15 feet. Lean clay with sand was encountered from 15 feet to the bottom of the test pit at 20 feet.

It is our understanding that the floor level for this structure will be at about elevation 7727 feet. Tabulated below is the ground elevation at the three test pit locations:

| | |
|---|---|
| MDF-1 | 7720.4 feet |
| MDF-2 | 7729.6 feet |
| MDF-3 | 7744.0 feet |

It is apparent that about 7 feet of fill will be required to meet final grade on the westerly side of the building site (MDF-1), and that 17 feet of cut will be required on the easterly side of the building site (MDF-3). The native lean clay has relatively high dry strength; however, this material has collapsible characteristics and will experience significant settlement if it becomes wet.

Options for foundation support include (1) supporting the structure on spread footings and providing partial mitigation against settlement associated with collapsible soils, and (2) supporting the structure on deep foundations extending below the collapsible lean clay layers.

*(1) Spread Footings*

As indicated above, the native lean clay has relatively high dry strength. If these soils become wet, the soil matrix will collapse and settlement will occur. Up to 20 inches of settlement is possible under saturated conditions. If precautions are taken to prevent the native lean clay from becoming wet, the structure can be supported on spread footings. These precautions should include providing positive drainage away from the building and installing an impervious membrane extending at least 6 feet beyond the outside footings. While this action will reduce the risk of moisture entering the subgrade clay, the owner should be made aware that significant settlement will occur if these soils become wet.

An allowable soil bearing capacity of 2500 psf can be used for spread footings supported on the native lean clay and fill compacted to the recommendations outlined in Section IV. Shallow foundation support will be satisfactory provided that the native lean clay does not become wet during the design life of the structure.

*(2) Deep Foundations*

It is our opinion that drilled shafts represent the most efficient deep foundation option for this structure. To minimize downdrag forces if the collapsible soils become wet, it is recommended that 2 foot diameter drilled shafts be used with the ends belled for increased capacity. It is recommended that the shafts extend to elevation 7700 feet. Shown in the following table are allowable capacities for end bearing drilled shafts terminating in the stiff lean clay at a depth of about 27 feet below the finished pad level.

Procedures outlined in FHWA-H1-88-042, "*Drilled Shafts: Construction Procedures and Design Methods*" have been used to determine size and load capacities. It has been assumed that high quality construction, good specifications and excellent inspection will exist for the structure. The capacities are based upon end bearing only, and it is, therefore, essential that the base of the shafts be cleaned to remove all loose debris.

Based upon these assumptions, a factor of safety of 2.5 has been selected. The shafts can be belled to achieve the required base diameter.

Tabulated below are capacities for compression loading for various diameters of shafts.

| Shaft Diameter (ft) | Total Compressive Capacity (kips) | Allowable Compressive Capacity (kips) – f.s. = 2.5 |
|---|---|---|
| 2 | 40 | 16 |
| 3 | 89 | 35 |
| 4 | 158 | 63 |
| 5 | 247 | 99 |

The design of rebar and concrete should follow established guidelines. If this option is used, it is recommended that inspection of the shaft excavations be made by the soils engineer prior to placement of concrete.

## B. SHOP / WAREHOUSE – (Test Pits WSF-1, WSF-2, & WSF-3)

Test Pits WSF-1, 2 and 3 define the characteristics of the subsurface profile in the vicinity of the proposed Shop / Warehouse structure. It will be noted from the test pit logs that the soil profile includes a 1 foot sandy lean clay layer underlain by 3 to 5 feet of coal fill. In Test Pit WSF-1 a 2 foot layer of sandy clay was encountered below the coal fill, followed by highly weathered sandstone to the bottom of the test hole at 13 feet. Test Pit WSF-2 encountered loose silty sand with gravel below the coal fill from 3.5 to 8.5 feet. The silty sand was followed by layers of sandy clay and clayey sand from 8.5 to 12 feet, then gravel with cobbles and boulders to the bottom of the test pit at 16 feet. The profile in Test Pit WSF-3 consists of loose silty sand with gravel below the coal fill from 3 to 9 feet, followed by a 2.5 foot layer of sandy clay to 11.5 feet, then medium dense silty sand from 11.5 to 15 feet.

It is our understanding that the floor level for this structure will be at about elevation 7728 feet. Tabulated below is the ground elevation at the three test pit locations:

| | |
|---|---|
| MSF-1 | 7719.5 feet |
| MSF-2 | 7721.6 feet |
| MSF-3 | 7718.7 feet |

It is apparent that 6 to 9.5 feet of fill will be required to meet final grade throughout the building site. It is recommended that the loose coal fill be removed from beneath the building area prior to placement of fill. Assuming that the native soils (including lean clay, sand, and gravel) are used to establish final grade, and that compaction requirements outlined in Section IV are complied with, footings can be designed using an allowable soil bearing capacity of 3500 psf, except that in no case should the width of any footing be less than 2 feet.

Up to 3 feet of collapsible soils were encountered in Test Pits WSF-2 and 3. The sample from 9 feet in Test Pit WSF-3 experienced about 3% settlement upon wetting. It is estimated that 1 inch of additional settlement may occur if these soils become saturated.

## C. COVERED STORAGE AND FUEL STRUCTURE – (Test Pits CS-1 and F-1)

Test Pits CS-1 and F-1 define the characteristics of the subsurface profile in the vicinity of the proposed Covered Storage and Fuel Structure sites. It will be noted from the test pit logs that the soil profile includes a 0.5 to 1 foot sandy lean clay layer underlain by 7 to 8.5 feet of loose fill consisting of coal, and layers of coal and clayey sand with gravel. In Test Pit CS-1, sandy lean clay was encountered below the coal fill, extending from 8.5 to 16 feet, followed by a 2 foot layer of sandy gravel. The lean clay exhibits collapse characteristics. Test Pit F-1 encountered 4 feet of sandy clay and clayey sand layers below the 7 feet of loose fill, followed by sand and gravel from 11 to 16 feet.

It is our understanding that the floor level for these structures will be at about elevation 7728 feet. Tabulated below is the ground elevation at the two test pit locations:

| | |
|---|---|
| CS-1 | 7716.6 feet |
| F-1 | 7724.0 feet |

It is apparent that 4 to 11 feet of fill will be required to meet final grade throughout the building sites. It is recommended that the loose coal fill be removed from beneath the building areas prior to placement of fill. Assuming that the native soils (including lean clay, sand, and gravel) are used to establish final grade, and that compaction requirements outlined in Section IV are complied with, footings can be designed using an allowable soil bearing capacity of 3500 psf, except that in no case should the width of any footing be less than 2 feet.

Up to 5 feet of collapsible soils were encountered in Test Pit CS-1 between 10 and 16 feet below the existing ground surface. It is estimated that up to 2 inches of additional settlement may occur if these soils become saturated. Since the moisture sensitive soils will be about 20 feet below final grade, it is our opinion that the risk of saturation and collapse of this layer once the structures are in place is relatively low.

## D. CONVEYOR SECTION–1 (Boring Portal 1 and Test Pit TT-1-2)

Boring Portal-1 and Test Pit TT-1-2 were placed along the alignment for Conveyor Section-1. It will be noted from the boring log that the subsurface profile in the portal area consists of interbedded siltstone and sandstone gravels and cobbles in a sandy silt matrix with occasional clay layers to a depth of about 18 feet (elev. 7873'). A 4 foot coal layer was encountered between elevation 7873 and 7869 feet, followed by 6 inches of highly weathered mudstone; then relatively competent sandstone to the bottom of the boring at 25 feet (elev. 7865').

The ground elevation at Test Pit TT-1-2 was 7873.1 feet, and the profile consists predominantly of silty clay with gravel to a depth of 4 feet (elev. 7869'), followed by clayey gravel with cobbles to the bottom of the test pit at a depth of 8 feet (elev. 7865').

It is our understanding that the portal pad elevation will be at 7869 feet. Structures contemplated along this section include the portal entrance, conveyor supports and the transfer tower. At elevation 7869 feet, the portal excavation will extend into bedrock. It is recommended that supports not be founded on the coal or the highly weathered mudstone. We recommend that foundation support areas extend through these materials and into the underlying sandstone. It is recommended that the sandstone be treated as a very dense sand to evaluate allowable bearing capacity for footings. For footings located on the sandstone or granular fill overlying the sandstone and compacted to an in-place density equal to at least 95% of the maximum laboratory density as determined by ASTM D 1557, we recommend that footings be designed using the allowable bearing capacities shown in the following table:

| FOOTING WIDTH (ft) | ALLOWABLE BEARING CAPACITY (psf) (assumes factor of safety = 2.5) |
|---|---|
| 2 | 5800 |
| 3 | 6900 |
| 4 | 7950 |
| 5 | 9050 |
| 6 | 10,100 |
| 7 | 9,800 |
| 8 | 9,500 |
| 12 | 8,800 |
| 16 | 8,500 |

The above capacities assume a minimum embedment depth of 2 feet and a maximum total settlement of 1 inch with differential settlement less than 0.5 inch.

The clay encountered in Test Pit TT-1-2 to elevation 7869 feet has collapsible characteristics and we recommend that no foundations be supported on this material. It appears that foundations for the conveyor section will extend into the gravelly clay and clayey gravel with cobbles and boulders below an elevation of 7869 feet. If the conveyor is supported using spread footings, it is recommended that an allowable bearing capacity of 2500 psf be used for the clay soils.

For this conveyor section, capacities for drilled shafts extending 8 to 10 feet into the gravelly clay and clayey gravel are shown in the following table:

| Shaft Diameter (ft) | Total Compressive Capacity (kips) | Allowable Compressive Capacity (kips) – f.s. = 2.5 |
|---|---|---|
| 2 | 42 | 17 |
| 3 | 84 | 34 |
| 4 | 141 | 56 |
| 5 | 211 | 84 |

It is recommended that lateral bearing be determined using procedures outlined in Section 1804 and 1805 of the 2006 edition of the International Building Code (IBC). It is recommended that Material Class 5 (CL) be used with a lateral bearing of 100 psf per foot. L-Pile Parameters can be provided upon request for specific locations.

It is apparent from Figures 2 and 8 that the transfer tower will be located on compacted fill. It is anticipated that the collapsible clay layer, which extended to a depth of about 4 feet, will also exist in the area where the transfer tower is planned. If the transfer tower is supported on spread footings, it is recommended that the collapsible clay layer be excavated prior to placement of fill. Under this scenario, the footings placed on compacted fill can be designed using an allowable bearing capacity of 3500 psf, following recommendations outlined in Section V.B.

## E. CONVEYOR SECTION–2 (Test Pit CV-2-1, Boring CV-2-2, & Test Pit CV-2-3)

Test Pit CV-2-1, Boring CV-2-2, and Test Pit CV-2-3 were placed along the alignment for Conveyor Section-2. The soil profile for each of these test holes is discussed separately below:

***Test Pit CV-2-1***

This test pit encountered stiff lean clay with gravel and cobbles to a depth of 3.5 feet, followed by 6 inches of coal. Below the coal, the profile consists of cobbles and boulders in a silty sand matrix to a depth of 14 feet, followed by competent sandstone to the bottom of the boring at 19 feet.

***Boring CV-2-2***

The boring encountered sandy clay to a depth of 3 feet, followed by medium dense to dense silty sand with gravel to 24 feet. A layer of lean clay was encountered between 24 and 30 feet. The clay was underlain by dense silty sand with gravel to the bottom of the boring at 32 feet.

*Test Pit CV-2-3*

This test pit encountered stiff sandy lean clay with gravel fill to a depth of 6.5 feet, underlain by 6 inches of coal. Native very stiff sandy clay with gravel was encountered between a depth of 6 and 11 feet, followed by sandstone to the bottom of the test pit at 15 feet.

Foundations for this conveyor section can be designed using the recommendations provided for Conveyor Section 1 in Section V., except that no footings should be located on the existing clay fill. Where fill is encountered, it is recommended that the foundations either extend below the fill, or that the fill be excavated and replaced as compacted fill under controlled conditions.

## F. CONVEYOR SECTION–3 (Borings NS-1 and S-1)

Borings NS-1 and S-1 were placed along the alignment for Conveyor Section-3. It will be noted from the boring logs that the subsurface profile at each of these locations consists predominantly of very stiff sandy lean clay with some gravel and occasional cobbles and boulders lower in the profile. The borings extended to a depth of about 50 feet, terminating at elevation 7735 feet.

It will be noted from Figure 4 that a significant excavation will be required on the westerly side of the stockpile area and that some filling will be required on the easterly side to provide the pad elevation at 7780 feet. The ground elevation at the boring locations is at about 7785 feet. Some samples of the clay in the upper 5 feet have a pinhole type structure characteristic of collapsible soils. Samples deeper in the profile between elevation 7730 and 7715 feet exhibited expansive characteristics for load intensities less than about 2 tsf. The allowable bearing capacity for spread footings located between elevation 7775 and 7755 feet will be controlled by the stiff lean clay.

It is recommended that spread footings be designed using an allowable bearing capacity of 2500 psf. The magnitude of large area loads associated with the coal stockpiles are not known as of the preparation of this report. If the area loads exceed 500 psf, it is recommended that an analysis be performed to evaluate the settlement associated with large area loads.

## G. CONVEYOR SECTION–4 (Borings CV-4-1 and SC-2)

Borings CV-4-1 and SC-2 were placed along the alignment for Conveyor Section-4, with SC-2 located at the location of the proposed screening and crushing facility. Boring CV-4-1 was

located at elevation 7776 feet and encountered lean clay with gravel and occasional cobbles and boulders throughout the depth investigated, terminating at a depth of 71 feet (elev. 7705'). Boring SC-2 was located at ground elevation 7741 feet and extended to a depth of about 31 feet (elev. 7710'). It will be noted from the boring log that no sampling was performed in the upper 19 feet. At the time drilling was performed, it was assumed that this material would be removed.

It will be noted from Figure 2 that the pad elevation for the Screening and Crushing facility is at 7742 feet. It is recommended that this structure be supported on drilled shafts extending to a depth of at least 25 feet. Recommendations provided in Section V.A. Mine Dry / Office *(2) Deep Foundations* are applicable to this site.

It is recommended that foundations for the conveyor along this section also be supported on drilled shafts extending to a depth of 8 to 10 feet in the vicinity of Boring CV-4-1 and 25 feet in Boring SC-2. Foundations for this conveyor section can be designed using the recommendations provided for Conveyor Section 1 in Section V., except that no footings should be located on the existing clay fill.

## H. CONVEYOR SECTION–5 (Test Pits CV-5-1 and CV-5-2)

Test Pits CV-5-1 and CV-5-2 were placed along the alignment for Conveyor Section-5. Each of the test pits encountered fill consisting of lean clay with layers of coal and silt to a depth of 5 feet in Test Pit CV-5-1 and 11.5 feet in Test Pit CV-5-2. The fill was underlain by sandy lean clay which exhibited a pinhole structure characteristic of collapsible-type soils. The sample obtained at a depth of 9 feet in Test Pit CV-5-1 settled approximately 8% when saturated. The sample obtained at a depth of 12 feet in Test Pit CV-5-2 exhibited a 2% swell when saturated.

The proposed pad elevation for this area is at 7232 feet. The elevation of the two test pits are as follows:

| | |
|---|---|
| CV-5-1 | 7737.7 feet |
| CV-5-2 | 7749.8 feet |

It will be noted that Test Pit CV-5-2 located near the Truck Loadout only extended to elevation 7730 feet, 2 feet below the pad level. It is recommended that foundations for the Truck Loadout facility bypass the moisture sensitive clay in the upper portion of the soil profile. Based upon the two test pits, it appears that these clays extend to at least elevation 7715 feet. We recommend that the structure be supported on drilled shafts extending to an estimated depth of 30 feet below the pad level, to about elevation 7702 feet. We recommend

that an additional boring be located at the Truck Loadout site to evaluate the characteristics of the subsurface soil. We recommend that the conveyor system also be supported on drilled shafts extending to a depth of 8 to 10 feet below the pad level.

Recommendations provided in Section V.A. Mine Dry / Office (2) Deep Foundations are applicable to this area.

## I. DETENTION POND

It is our understanding that a below ground detention pond is planned at the north side of the property at the approximate location shown in Figure 2. We understand that the pond will be sized to hold between 2.5 and 2.7 acre feet with the bottom 12 to 15 feet below the existing ground surface. No test holes were located in the detention pond area; however, test pits CV-5-1 and CV-5-2 located a few hundred feet south of the area both encountered fill to depths varying from 5 to 12 feet. The fill has interbedded layers of coal, sandy gravel and lean clay. It is recommended that the excavation side slopes be cut at 3 horizontal to 1 vertical. If fill is encountered, it is recommended that the cut be over-excavated a distance of at least 10 feet into the side slope, and that this zone be replaced with engineered fill. On site material can be used as engineered fill provided that it is placed in lifts not exceeding 8 inches, moisture conditioned and compacted in accordance with the recommendations provided in Section IV of this report. It is also recommended that the detention pond be lined with 18 inches of compacted lean clay obtained from on-site excavations and that a 6 inch layer of sandy gravel be placed over the liner to protect the clay from cracking.

## J. ROADWAYS

The project will require cuts and fills for roadway construction throughout the development. For shallow cuts less than 20 feet in the native clayey soils, we recommend that slopes of 1.25H:1V or flatter be used. Fill slopes less than 20 feet high and constructed of clayey soils may slope as steeply at 1.5H:1V. Fill slopes constructed of sandy soils should be sloped at 1.8H:1V or flatter. Slopes for roadway fills and cuts with heights or depths greater than 20 feet should be designed in conformance with the slope stability recommendations in Section VI of this report.

## K. SEISMIC CONSIDERATIONS

As indicated earlier in this report, the site is located in Seismic Zone 2B according to the 1997 edition of the Uniform Building Code. Soil profile type $S_D$ should be used for structural

seismic design, with the Uniform Building Code. The site is classified as Site Class D, as per Section 1613 of the 2006 International Building Code.

The site is located at latitude 39.7330° North and longitude 111.1535° West. Probabilistic peak ground acceleration (PGA) values are tabulated below:

Probabilistic ground motion values in %g.

| | 10%PE in 50 yr | 2%PE in 50 yr |
|---|---|---|
| PGA | 12.19 | 27.94 |
| 0.2 sec SA | 28.21 | 64.33 |
| 1.0 sec SA | 9.46 | 21.94 |

The allowable soil bearing pressure indicated above may be increased by one-third where seismic forces are involved in the structural loads. If the passive pressures associated with footings and walls are used to resist seismic forces, and if backfilling is performed using granular material, we recommend that the passive pressures be calculated from the lateral earth pressure equation using an earth pressure coefficient of 2.0. If the frictional resistance of the footings and floor slabs are used to resist seismic forces, we recommend a coefficient of friction of 0.40 be used to calculate these forces.

Since the groundwater level is at a substantial depth below the ground surface and since the subsurface soil profile consists predominantly of lean clay and gravel, problems associated with liquefaction during a seismic event are unlikely at this location, and no special mitigation of the foundation soils is required.

## VI. SLOPE STABILITY

The proposed development will require earthwork to establish roadways, level structure areas, and a detention basin on the hillside. Figures 3 through 8 show sections cut at locations as shown in Figure 2. The purpose of these sections is to evaluate the stability of the proposed cut and fill slopes.

It will be noted from the section drawings that the proposed fill slopes range from about 1.5H:1V to 2H:1V. The proposed cut slopes are steeper, varying from about 0.8H:1V to 1.4H:1V. The section drawings also show the locations of test holes performed in the vicinity of the section lines. The holes applicable to each section are summarized on the table below, along with the predominant soil types and brief descriptions of the proposed earthwork in the area.

| Section | Earthwork Description (as shown on sections) | Test Hole No. | Depth (ft) | Soil / Rock Description |
|---|---|---|---|---|
| A-A | Cut Slopes 0.8H:1V to 1.4H1V Fill Slope 1.5H:1V | CV-5-1 TH | 19.5 | Stiff Sandy Lean Clay |
| | | CV-4-1 DRL | 71.5 | Stiff Sandy and Gravelly Lean Clay |
| | | SC-2 DRL | 30.5 | Stiff Sandy Lean Clay (not sampled above 19') |
| B-B | Cut Slope 0.8H:1V File Slope 1.5H:1V | NS-1 DRL | 50 | Stiff Lean Clay, with some dense Sand and Gravel layers |
| | | S-1 DRL | 76.5 | Stiff Sandy Lean Clay |
| C-C | Cut Slope 0.8H:1V Fill Slope 1.8H:1V | CV-2-2 DRL | 31.5 | Silty Clay to 3', Silty Sand from 3' to 24' Stiff Lean Clay from 24' to 30.5', then Sand |
| D-D | Cut Slope 1.25H:1V Fill Slope 2H:1V | WSF-3 TH | 19.5 | Silty Sand and Lean Clay layers, some coal in upper 3' |
| | | WSF-2 TH | 16 | Silty Sand and Lean Clay layers, some coal in upper 3', gravel below 12' |
| E-E | Cut Slope 1H:1V Fill Slopes 2H:1V | MDF-1 TH | 19.5 | Stiff Sandy Lean Clay |
| | | MDF-2 TH | 19.5 | Stiff Sandy Lean Clay with Silty Sand layer |
| | | MDF-3 TH | 19.5 | Silty Sand, Gravel and Lean Clay layers, some coal in upper 2' |
| F-F | Cut Slope 0.8H:1V Fill Slope 1.8H:1V | TT-1-2 TH | 8 | Silty Clay to 4', then Gravel with Clay |
| | | Portal-1 DRL | 25 | Silty Gravel with some Clay layers to 14' Sandstone, Mudstone, Coal from 14' to 25' |

Stability analyses were performed using the computer program Slope/W. Spencer's method, which satisfies both force and moment equilibrium requirements, was used to compute factors of safety. Potential circular failure surfaces were evaluated using a grid and radius approach.

Stability analyses were performed primarily for Sections A-A, B-B and F-F. At Sections A-A and B-B, the predominant soil type was assumed to be stiff lean clay. Based on the results of field and laboratory testing, this material was assigned an internal friction angle of 30 degrees with cohesion of 250 psf. At Section F-F, the portal drill hole encountered gravelly material in a silty matrix in the upper 10 to 15 feet, underlain by lean clay and rock. This gravelly material was modeled using a friction angle of 35 degrees and 100 psf cohesion.

At Sections A-A, B-B and F-F, the cut slopes were initially modeled as shown on the section drawings, with slopes as steep as 0.8H:1V. For these slopes, the computed factors of safety were in the range of 1.0 to 1.2. Following the initial stability analyses, additional calculations were performed to estimate factors of safety for flatter cut slopes. A summary of computed factors of safety is shown below, and the critical failure surfaces are shown in the appendix.

| Section | Cut Slope | Approximate Depth of Cut (ft) | Factor of Safety |
|---|---|---|---|
| A-A | 0.8H:1V | 35 | 1.17 |
| | 1H:1V | 39 | 1.24 |
| | 1.25H:1V | 44 | 1.35 |
| | 1.5H:1V | 56 | 1.41 |
| | 1.75H:1V | 67 | 1.50 |
| B-B | 0.8H:1V | 69 | 0.91 |
| | 1H:1V | 75 | 1.00 |
| | 1.25H:1V | 88 | 1.10 |
| | 1.5H:1V | 113 | 1.19 |
| | 1.75H:1V | 153 | 1.29 |
| F-F | 0.8H:1V | 23 | 1.07 |
| | 1H:1V | 30 | 1.19 |
| | 1.25H:1V | 35 | 1.32 |
| | 1.5H:1V | 40 | 1.45 |
| | 1.75H:1V | 45 | 1.57 |

The acceptable factor of safety for a given slope depends upon several factors, including the level of certainty and conservatism of model parameters, as well as the nature of the slope and potential consequences of failure. For static, long-term conditions, required minimum factors of safety typically range from about 1.3 to 1.5, with the 1.5 factor used for more critical facilities. For Sections A-A and F-F, an estimated factor of safety of 1.3 or better is achieved for slopes of 1.25H:1V. To achieve an estimated factor of safety of 1.5, the slopes would have to be flattened to about 1.75H:1V. It will be noted that the deep cut on Section B-B has a factor of safety of almost 1.3 only if flattened to 1.75H:1V.

We recommend that permanent cut slopes greater than 10 feet deep in the native silty gravel and lean clay materials be no steeper than 1.25H:1V, in order to provide an estimated factor of safety of 1.3. A greater factor of safety may be required by regulatory agencies, policies, or the facility owner, and can be achieved by further flattening the cut slopes.

It is likely that cut slopes for the pads on the easterly side of the development will be located on the upthrown side of the fault which runs through the site. It appears that the borings throughout this area were located on the downthrown side of the fault. The geology report for the project (prepared by others) references sandstone outcrops and prior boring logs which show a dominance of sandstone to be the norm in the area. Near-vertical sandstone outcrops were observed east of the borings on the north end of the site by RB&G's geologist during field exploration work.

Where the proposed cuts encounter bedrock, they can be performed at near vertical angles in sandstone, and at relatively steep overall angles in interbedded sandstone/mudstone without jeopardizing overall slope stability. Problems associated with the interbedded degradable clay/mudstone layers limit the steepness of the cut, however. It is recommended that the overall

cut slope at these locations be no steeper than 0.8H:1V. It is also recommended that horizontal benches be constructed at the top of degradable clay and mudstone layers, such that a resultant slope in these layers of 1.5H:1V can be achieved without undercutting the overlying ledge rock. If the horizontal benches are not feasible, long term maintenance associated with ledge rock fall should be planned as the mudstone weathers and degrades, resulting in undercutting of the ledges.

It is anticipated that fill slopes will be created with on-site material. If this material is placed and compacted in accordance with recommendations provided in Section IV, fill slopes as steep as 1.5H:1V will have a factor of safety of at least 1.3 if constructed of the native clayey soils. Fill slopes shown on Sections A-A, B-B, and FF will likely be constructed of this clayey on-site fill. Test pits in the vicinity of the fill areas shown on Sections C-C, D-D, and E-E encountered significant amounts of medium-dense silty sand. Fill slopes as steep as 1.8H:1V constructed of this silty sand material have a computed factor of safety of at least 1.3. Plots of stability analyses for typical fill slopes are included in the appendix.

Cut and fill slopes will be susceptible to erosion and shallow surficial failures – particularly for slopes steeper than 2H:1V. We recommend that soil slopes be seeded and erosion control blankets provided where necessary to minimize such problems on bare slopes.

## VII. LIMITATIONS

The conclusions and recommendations presented in this report are based upon the results of the field and laboratory tests. It should be recognized that soil materials are inherently heterogeneous and that conditions may exist throughout this site which could not be defined during this investigation. Since the bearing capacity for foundation design and slope stability are dependent upon adequate compaction of fill, it is requested that testing of the fill be performed under the direct supervision of the soils engineer.

It is recommended that a soils engineer observe the foundation excavations prior to placement of footings. If during construction, conditions are encountered which appear to be different than those presented in this report, it is requested that we be advised in order that appropriate action may be taken.

# Unified Soil Classification System

| Major Divisions | | | Group Symbols | | Typical Names | Laboratory Classification Criteria | | |
|---|---|---|---|---|---|---|---|---|
| COARSE-GRAINED SOILS *more than half of material is larger than No. 200 sieve* | Gravels *more than half of coarse fraction is larger than No. 4 sieve size* | Clean Gravels *little or no fines* | GW | | Well graded gravels, gravel-sand mixtures, little or no fines | *For laboratory classification of coarse-grained soils* | $C_u = \frac{D_{60}}{D_{10}}$ Greater than 4<br>$C_c = \frac{(D_{30})^2}{D_{10} \times D_{60}}$ Between 1 and 3 | |
| | | | GP | | Poorly graded gravels, gravel-sand mixtures, little or no fines | | Not meeting all gradation requirements for GW | |
| | | Gravels With Fines *appreciable amount of fines* | GM* | d<br>u | Silty gravels, poorly graded gravel-sand-silt mixtures | Determine percentage of gravel and sand from grain-size curve.<br>Depending on percentage of fines *(fraction smaller than No. 200 sieve size)*, coarse-grained soils are classified as follows:<br>Less than 5% GW, GP, SW, SP<br>More than 12% GM, GC, SM, SC<br>5% to 12% Borderline cases requiring use of dual symbols** | Atterberg limits below "A" line, or PI less than 4 | Above "A" line with PI between 4 and 7 are borderline cases requiring uses of dual symbols |
| | | | GC | | Clayey gravels, poorly graded gravel-sand-clay mixtures | | Atterberg limits above "A" line, or PI greater | |
| | Sands *more than half of coarse fraction is smaller than No. 4 sieve size* | Clean Sands *little or no fines* | SW | | Well graded sands, gravelly sands, little or no fines | | $C_u = \frac{D_{60}}{D_{10}}$ Greater than 6<br>$C_c = \frac{(D_{30})^2}{D_{10} \times D_{60}}$ Between 1 and 3 | |
| | | | SP | | Poorly graded sands, gravelly sands, little or no fines | | Not meeting all gradation requirements for SW | |
| | | Sands with Fines *appreciable amount of fines* | SM* | d<br>u | Silty sands, poorly graded sand-silt mixtures | | Atterberg limits below "A" line, or PI less than 4 | Above "A" line with PI between 4 and 7 are borderline cases requiring uses of dual symbols |
| | | | SC | | Clayey sands, poorly graded sand-clay mixtures | | Atterberg limits above "A" line, or PI greater | |
| FINE-GRAINED SOILS *more than half of material is smaller than No. 200 sieve* | Silts and Clays *liquid limit is less than 50* | | ML | | Inorganic silts and very fine sands, rock flour, silty or clayey fine sands or clayey silts with slight plasticity | *For laboratory classification of fine-grained soils* |  Plasticity Chart | |
| | | | CL | 1<br>2 | Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays | | | |
| | | | OL | | Organic silts and organic silt-clays of low plasticity | | | |
| | Silts and Clays *liquid limit is greater than 50* | | MH | | Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts | | | |
| | | | CH | | Inorganic clays of high plasticity, fat clays | | | |
| | | | OH | | Organic clays of medium to high plasticity, organic silts | | | |
| HIGHLY ORGANIC SOILS | | | Pt | | Peat and other highly organic soils | | | |

*NOTE: USCS Modified to include CL-type subcategories*

*Division of GM and SM groups into subdivisions of d and u for roads and airfields only. Subdivision is based on Atterberg limits; suffix d used when liquid limit is 28 or less and the PI is 6 or less, the suffix u used when liquid limit is greater than 28.

***Borderline classification*: Soils possessing characteristics of two groups are designated by combinations of group symbols. (For example GW-GC, well graded gravel-sand mixture with clay biner.)

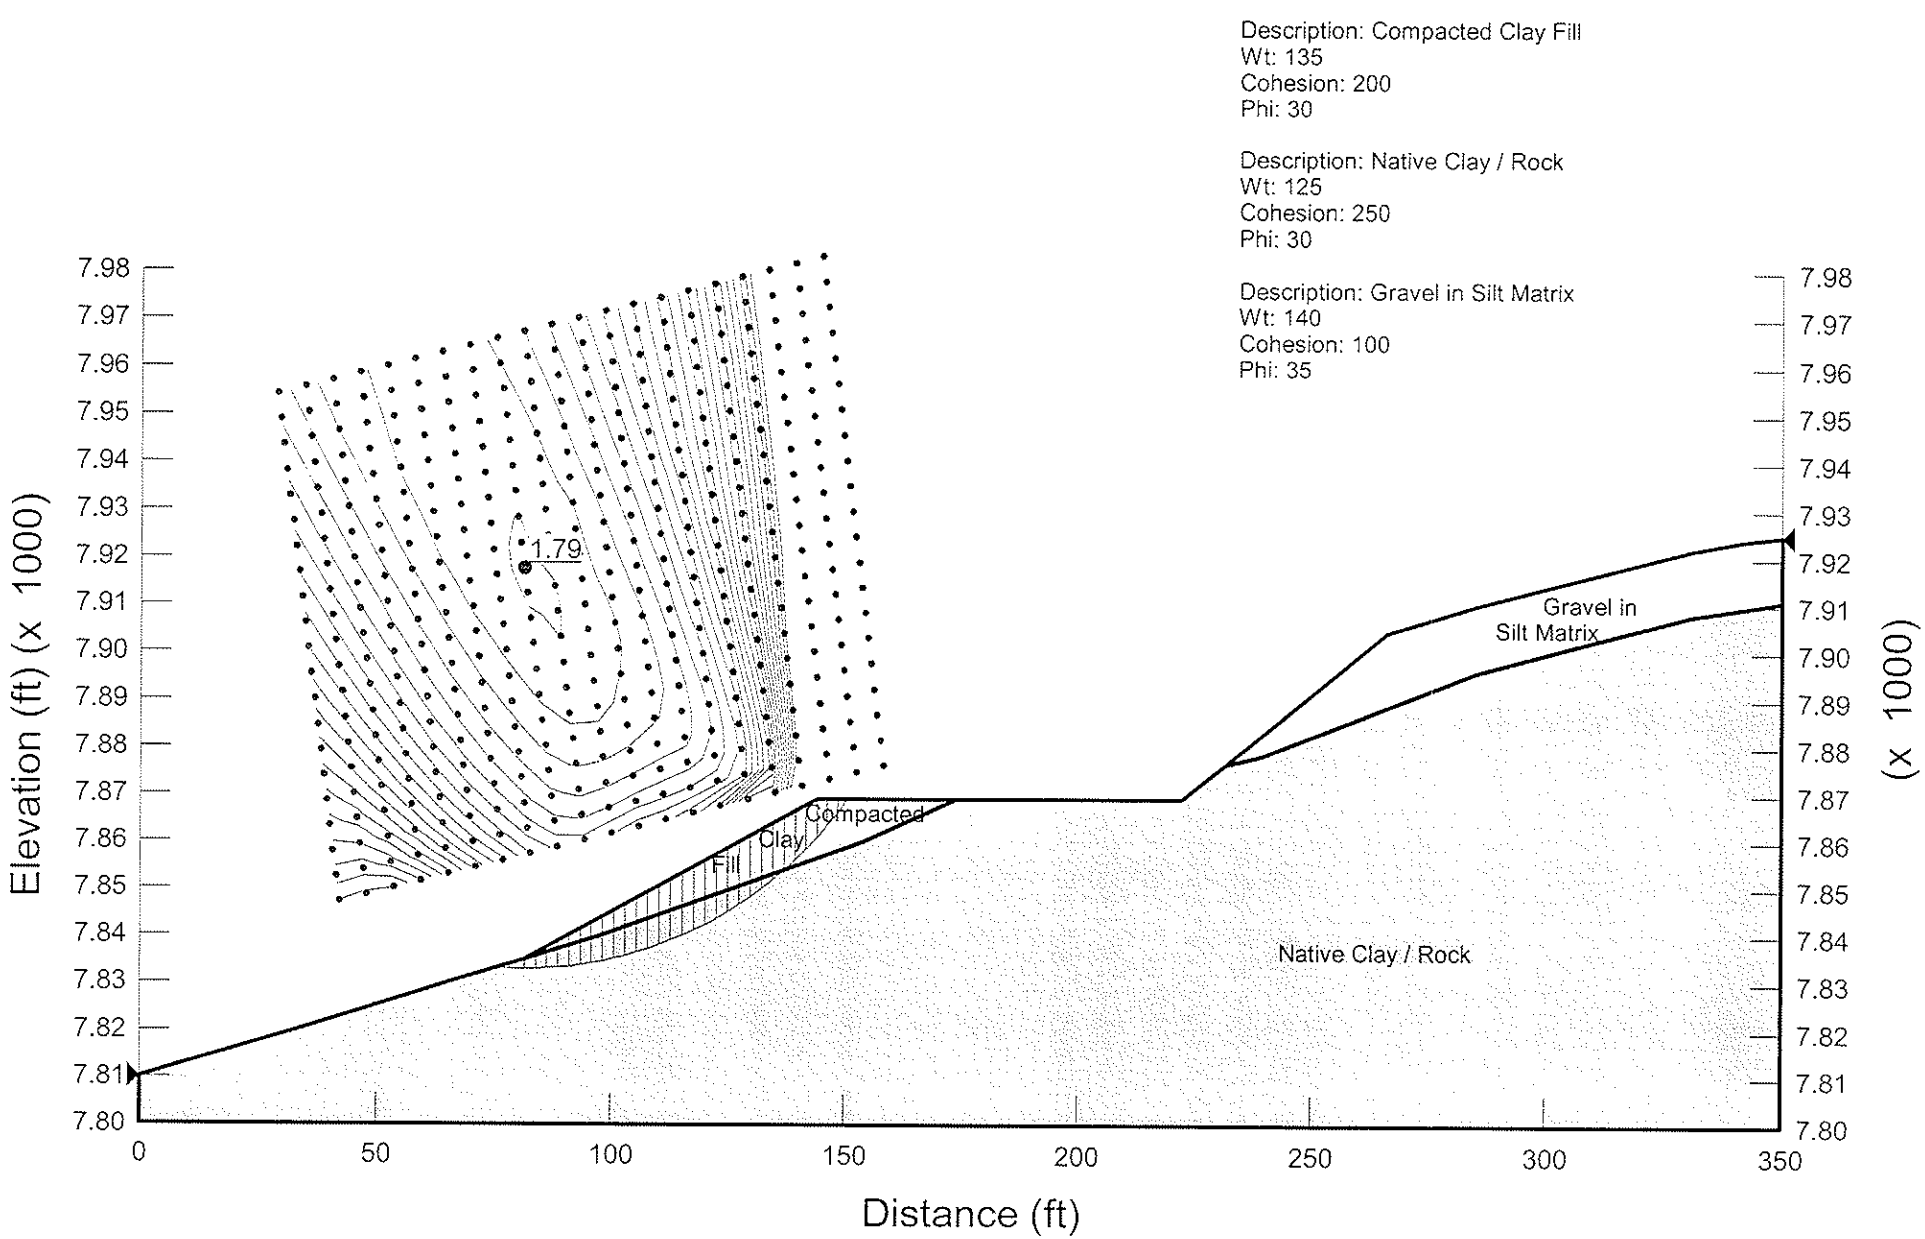


# Exhibit 15

# Kinney No. 2 Mine Blasting Plan

# EXHIBIT 15
# KINNEY NO. 2 MINE BLASTING PLAN

This blasting plan conforms to the Utah Coal Mining Rules R645-301-524 et. seq. The plan generally follows the format of the regulations, each regulation will be addressed as follows:

## 524.100 & 524.110

All surface blasting will be conducted under the direction of a certified blaster. Blasters will be qualified through the Division's blaster certification program.

## 524.120

Certificates of blaster certification will be carried by blasters or will be on file at a location within the permit area during blasting operations.

## 524.130

A blaster and at least one other person will be present for blasts.

## 524-140

The certified blaster responsible for blasting operations at the site will be familiar with the blasting plan and site-specific performance standards and give on-the-job training to persons who are not certified and who are assigned to the blasting crew or assist in the use of explosives.

## 524.210 – 524.240

Blasting may be required at the surface facilities of the Kinney No. 2 Mine located in the east half of the southeast quarter of Section 32, the west half of the west half of Section 33, Township 12 South, Range 7 East, Salt Lake Base & Meridian. Said areas can be seen on the Regional Land Use Map, Map 4. A portion of this area is within 1,000 feet of occupied buildings, and within 500 feet of abandoned coal mines in the area. In addition, portions of the area are adjacent to Highway 96.

### Blast Design

The blast design, as illustrated by Table 15-1, is intended to show the general layout and present general blasting information. Any significant deviation from this plan will be presented to the Division prior to the blast.

### Structures To Be Protected

Structures to be protected will include all structures within 1,000 feet of the area described above, including the convenience store on the corner of Highway 96 south of the permit area, and all dwellings and public building located within 1,000 feet of the blasting area described above. The locations of buildings and structures within a 1,000 foot zone of the potential blasting area can be seen on Map 11, Regional Surface Ownership Map.

## Blaster Signature

This plan has been signed by a certified blaster on the last page of the plan. In the event the blaster that signed the plan no longer works for Carbon Resources (CR), or is no longer certified, a new certified blaster will be secured to execute the plan, his signature will be placed in the space below the original blaster, and a copy of the signed plan will be filed in the blasting records file.

## 524.300

A preblasting survey will be performed when 5 or more pounds of explosive are used as follows:

**524.310** – At least 30 days before initiation of blasting, CR or its agent will notify, in writing, all residents or owners of dwellings, utilities or other structures located within on-half mile of the permit area, how to request a preblasting survey. Attachment A to this plan is a copy of a notification to be sent to the residents or owners of dwellings, utilities or other structures located within on-half mile of the permit area regarding their rights under the R645 rules to request a preblasting survey per R645-301-524.320.

**524.320** – A resident or owner of a dwelling, structure, or utility within one-half mile of any part of the permit area may request a preblasting survey. The request will be made in writing directly to CR or UDOGM, who will promptly notify CR. CR will promptly conduct a preblasting survey of the dwelling, structure or utility and promptly prepare a report of the survey. An updated survey of any additions, modifications, or renovatins ill be performed by CR if requested by a resident or owner.

**524.330** – CR will determine the condition of the dwelling, structure, or utility and will document any preblasting damage and other physical factors that could reasonably be affected by the blasting. Structures such as pipelines, cables, powerlines, and water systems will receive special attention, however, the assessment of these structures may be limited to surface conditions and other readily available data.

**524.340** – The written report of the survey will be signed by the person that conducted the survey. Copies of the report will be promptly provided to UDOGM and to the person requesting the survey. If the person requesting the survey disagrees with the contents and/or recommendations contained therein, he or she may submit to both CR and UDOGM a detailed description of the specific areas of disagreement.

**524.350** – Any surveys requested more than ten days before the planned initiation of blasting will be completed by CR before the initiation of blasting.

## 524.400

Blasting schedule: Blasting during construction of the Kinney No. 2 Mine surface facilities will begin any time after start of construction, which is scheduled to begin as soon after all appropriate permit approvals as possible. After construction is completed, blasting will be conducted as needed.

Blasting during initial site construction and during full mine operation will be done during daylight hours.

524.410 – Unscheduled blasts may occur for the following reasons:

- Where public safety requires
- Emergency blasting, such as boulders falling onto roadways, and etc.
- Destruction of damaged or deteriorated explosives or detonators in a safe manner
- Disposal of misfires and undetonated explosives
- Firing of charged holes as soon as practical after cessation of static electricity or stray current conditions when electrical detonators are used
- Firing of charged holes when weather conditions indicate the existence of a safety hazard is imminent

Residents of buildings or structures within one-half mile will be notified of unscheduled blasts using audible signals. CR will document the reason for the unscheduled blasts on the blasting records in accordance with R645-301-524.760.

524.430 – Written notice of blasting that is conducted within one-half mile of residents, structures, local governments, or utilities including Scofield Town, PacificCorp Power, and the Utah Department of Transportation will be given. A notice for blasting conducted during construction will be sent to the above entities weekly but in no case less than 24 hours before blasting will occur. The notices will contain the following:

- General location of the blasting
- Genera schedule
- General times of blasts
- Warning signals to be used before and after blasting

Notification to UDOT will be given that Highway 96 may be closed temporarily during blasting if a public safety hazard exists. A general notice of blasting will be placed in the Sun Advocate Newspaper before construction begins. Daily notices will be given each morning to the town of Scofield, and weekly notices will be given to UDOT if blasting during the following week has the potential to interfere with traffic on Highway 96.

524.500 & 524.510 – Blasting signs will be posted at the entrances to the Kinney No. 2 Mine site warning all who enter thereon of blasting. There are three possible entrances to the site, at the main entrance from Highway 96, at the private property road east of the site and the private property road at the north end of the permit area. The signs will be in accordance with R645-301-521.200 as follows:

- Signs will be posted, maintained, and removed by CR or its agent
- Signs will be of uniform design that can be easily seen and read
- Signs will be of durable materials and conform to local laws and regulations
- Signs will be maintained during all activities which they pertain

**524.511** - Signs reading "BLASTING AREA" will be placed at conspicuous places along the edge of Highway 96 adjacent to the permit boundary where blasting may occur.

**524.512** – Signs reading "WARNING! EXPLOSIVES IN USE" will be placed in conspicuous locations at all entrances to the permit area. The signs will also clearly list and describe the meaning of the audible blast warning and all-clear signals, and explain the marking of blasting areas and charged holes awaiting firing within the permit area.

**524.520** – CR or its agent will give warning and all-clear signals of different character that are audible within a range of one-half mile from the point of the blast. A single long tone will be sounded approximately three (3) minutes before all blasts as the warning signal and two (2) short tones from the siren will signal all clear after each blast. Persons within the permit area and persons who reside or work within on-half mile of the permit area will be notified of the meaning of the signals through appropriate written notification as addressed above.

**524.530** – Access within the blasting areas will be controlled to prevent the presence of livestock or unauthorized persons during blasting and until CR or its agent has determined that there are no unusual hazards and access to the travel within the blasting area can be safely resumed.

524.621 – Airblast will not exceed the limits below at the location of occupied dwellings or structures outside the permit area:

| Lower Frequency Limit of Measuring System, HZ(+3dB) | Maximum Level dB |
|---|---|
| 0.1 Hz or lower – flat response(1) | 134 peak |
| 2 Hz or lower – flat response | 133 peak |
| 6 Hz of lower – flat response | 129 peak |
| C-weighted – slow response(1) | 105 peak bBC |
| Note: (1) Only when approved by the Division | |

**524.631** – Periodic monitoring will be conducted to ensure compliance with airblast standards.

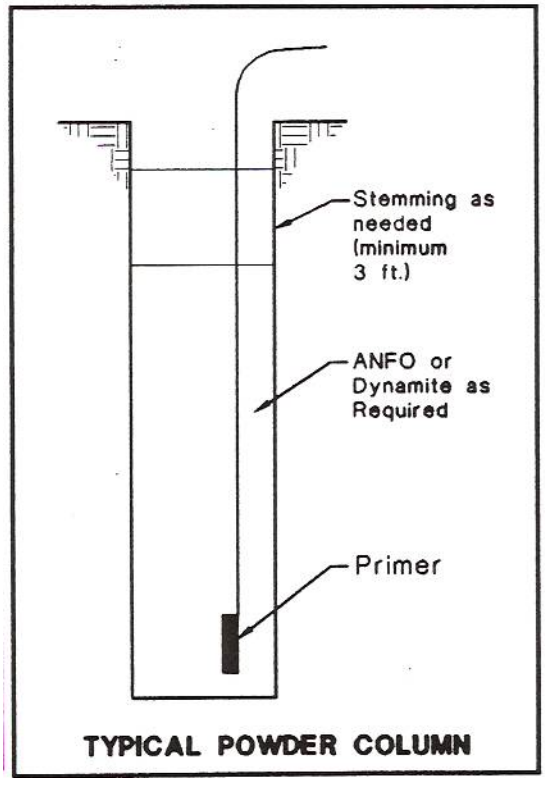
**524.632** – The measuring system used will have an upper-end flat frequency response of at least 200 Hz.

**524.633** – Flyrock traveling in the air or along the ground will not be cast from the blasting site more than one-half the distance to the nearest dwelling or other structure; beyond the area of control required under R645-301-524.530; or beyond the permit boundary.

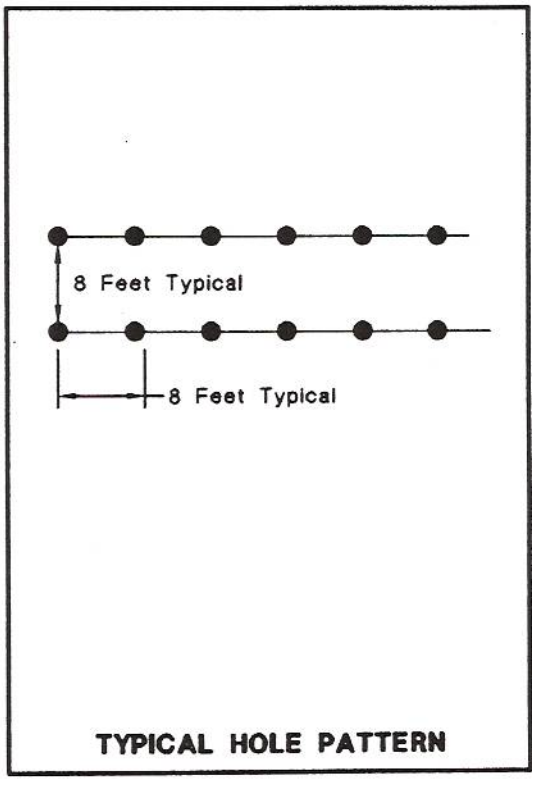
## Table 15-1

## BLASTING PARAMETERS

| | |
|---|---|
| Hole Depth | As needed |
| Hole Diameter | 2.5 inches |
| Hole Stemming | 3 ft. |
| Powder Column | As needed |
| Pounds of Powder Per Hole (ANFO Density @ 0.85 gm/cc) | 1.8 lbs/ft. ANFO, dynamite as needed |
| Powder Factor | 0.61 lb/BCY |
| Bank Cubic Yards Per Hole | depends on hole depth |
| Drilling Pattern | 8 ft. x 0 ft. |
| Primer | 1.5" x 8" stick dynamite for ANFO or cap for dynamite |



TYPICAL POWDER COLUMN



TYPICAL HOLE PATTERN

| |

**524.640** – CR or its agent will use the explosive equation for blasting set forth in R645301.524.651 to comply with the peak particle velocity limits as set forth in the Explosives Table given in R645-301-524.642. When deviations from the number of holes per delay, as calculated by the referenced equation occurs, a seismograph will be utilized to assure compliance.

**524.700** – Records of blasting will be maintained at the mine site for three years and will be available for inspection by the UDOGM or the public at reasonable times. The record of blasting will be on a form as shown as Table 15-2.

**524.750** – If required, a record of seismographic and airblast information will be recorded and attached to the blasting record. The contents of this record will be in accordance with R645-301-524.751 through R645-301-524.755.

**524.760** – The reason for unscheduled blasts will be recorded on the blasting record for the individual blast.

**524.800** – CR will comply with all appropriate Utah and Federal laws and regulations in the use of explosives.

To Whom It May Concern,

Re: Blasting By Kinney No. 2 Mine – Preblasting Survey

As per Utah Coal Mining Rules R645-301-524.310 et. seq., you have the right to request a preblasting survey of your structures that lie within on-half mile of the Kinney No. 2 Mine permit area shown on the attached map. This notice is required to be mailed to you at least 30 days before initiation of blasting when more than 5 pounds of blasting agent are used. Since blasting may be necessary during the construction phase of the project as well as during operation of the mine, this notice is being mailed to you before starting construction. We will notify you weekly of blasting that is planned during that week. You should evaluate your needs for a preblasting survey before the construction starts. You may request a preblasting survey any time during the life of the mine. Blasting will be done in compliance with the Utah Coal Mining Rules at R645-301-524.

According to R645-301-524.320, your request must be made in writing to either:

Carbon Resources
Kinney No. 2 Mine
Carbon Resources, LLC
P.O. Box 11789
Albuquerqui, New Mexico 87192

Or

Utah Coal Regulatory Program
Division of Oil. Gas and Mining
P.O. Box 145801
Salt Lake City, Utah 84114-5801

Carbon Resources will promptly conduct a preblasting survey of the structure and promptly prepare a written report of the survey. An updated survey of any additions, modifications, or renovations will be performed if requested. The report will contain:

1. The condition of the structure and will document any preblasting damage and other physical factors that could reasonably be affected by the blasting. The assessment of the structures may be limited to surface conditions and other readily available data and information.
2. The written report will be signed by the person who conducted the survey. Copies of the report will be provided to The Division of Oil, Gas and Mining and to you.

If you disagree with the contents of and/or the recommendations in the report, you may submit to us or the Division of Oil, Gas and Mining a detailed description of the specific areas of disagreement.

Any surveys requested more than ten days before the planned blasting will be conducted and completed before the initiation of blasting.

Sincerely,

Carbon Resources

# Chapter 3 Time of Concentration and Travel Time

Travel time ( $T_t$ ) is the time it takes water to travel from one location to another in a watershed. $T_t$ is a component of time of concentration ( $T_c$ ), which is the time for runoff to travel from the hydraulically most distant point of the watershed to a point of interest within the watershed. $T_c$ is computed by summing all the travel times for consecutive components of the drainage conveyance system.

$T_c$ influences the shape and peak of the runoff hydrograph. Urbanization usually decreases $T_c$, thereby increasing the peak discharge. But $T_c$ can be increased as a result of (a) ponding behind small or inadequate drainage systems, including storm drain inlets and road culverts, or (b) reduction of land slope through grading.

## Factors affecting time of concentration and travel time

### Surface roughness

One of the most significant effects of urban development on flow velocity is less retardance to flow. That is, undeveloped areas with very slow and shallow overland flow through vegetation become modified by urban development: the flow is then delivered to streets, gutters, and storm sewers that transport runoff downstream more rapidly. Travel time through the watershed is generally decreased.

### Channel shape and flow patterns

In small non-urban watersheds, much of the travel time results from overland flow in upstream areas. Typically, urbanization reduces overland flow lengths by conveying storm runoff into a channel as soon as possible. Since channel designs have efficient hydraulic characteristics, runoff flow velocity increases and travel time decreases.

### Slope

Slopes may be increased or decreased by urbanization, depending on the extent of site grading or the extent to which storm sewers and street ditches are used in the design of the water management system. Slope will tend to increase when channels are straightened and decrease when overland flow is directed through storm sewers, street gutters, and diversions.

## Computation of travel time and time of concentration

Water moves through a watershed as sheet flow, shallow concentrated flow, open channel flow, or some combination of these. The type that occurs is a function of the conveyance system and is best determined by field inspection.

Travel time ( $T_t$ ) is the ratio of flow length to flow velocity:

$$T_t = \frac{L}{3600V} \qquad \text{[eq. 3-1]}$$

where:

$T_t$ = travel time (hr)
L = flow length (ft)
V = average velocity (ft/s)
3600 = conversion factor from seconds to hours.

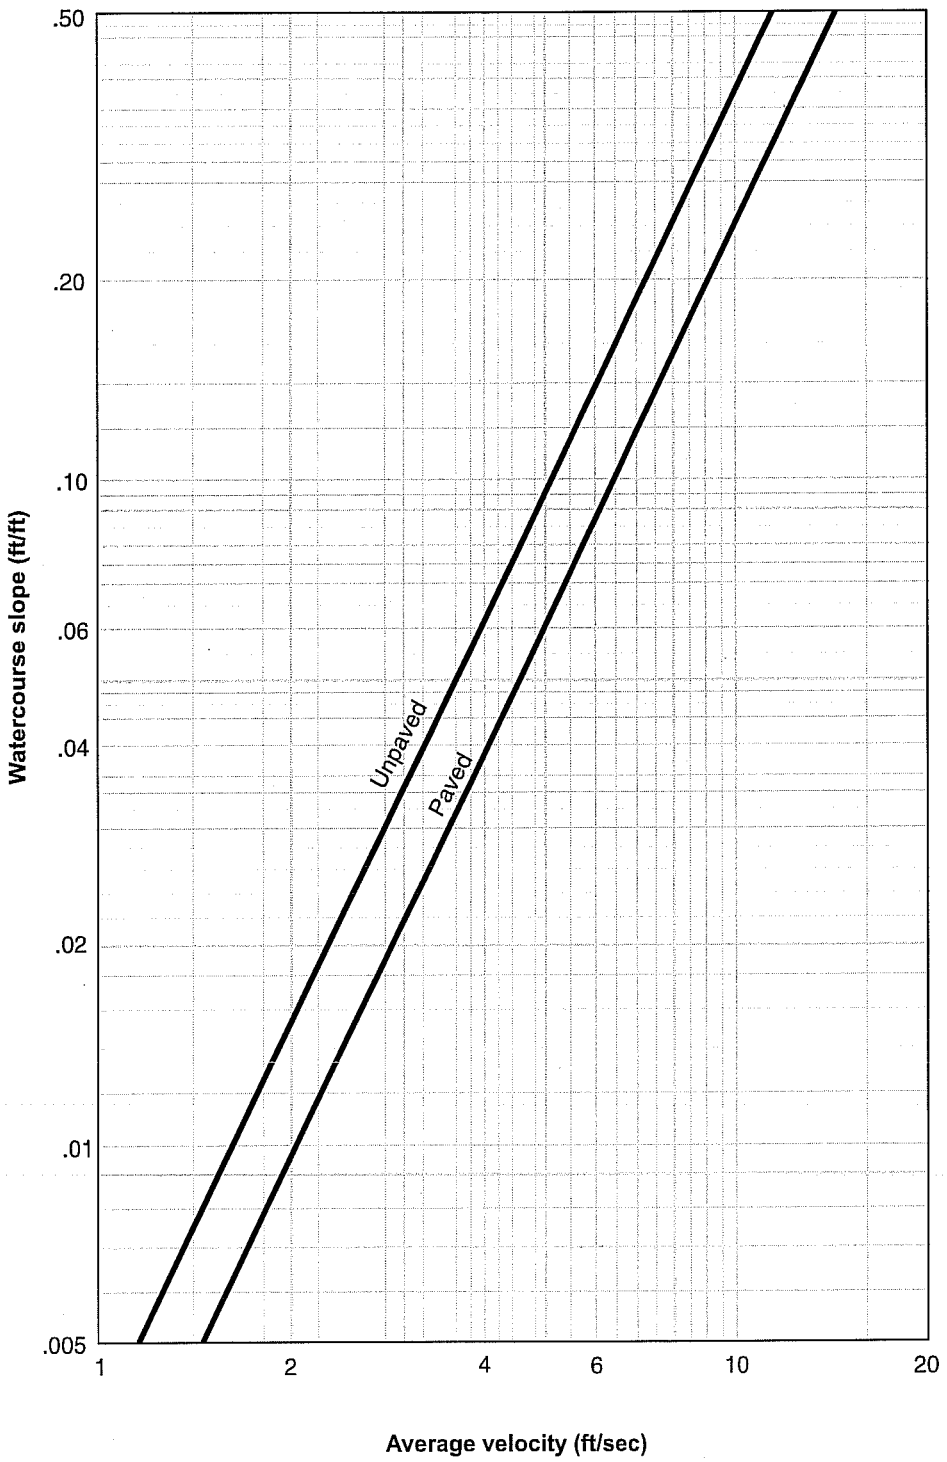
Time of concentration ( $T_c$ ) is the sum of $T_t$ values for the various consecutive flow segments:

$$T_c = T_{t_1} + T_{t_2} + \ldots T_{t_m} \qquad \text{[eq. 3-2]}$$

where:

$T_c$ = time of concentration (hr)
m = number of flow segments

**Figure 3-1** Average velocities for estimating travel time for shallow concentrated flow



## Sheet flow

Sheet flow is flow over plane surfaces. It usually occurs in the headwater of streams. With sheet flow, the friction value (Manning's n) is an effective roughness coefficient that includes the effect of raindrop impact; drag over the plane surface; obstacles such as litter, crop ridges, and rocks; and erosion and transportation of sediment. These n values are for very shallow flow depths of about 0.1 foot or so. Table 3-1 gives Manning's n values for sheet flow for various surface conditions.

**Table 3-1** Roughness coefficients (Manning's n) for sheet flow

| Surface description | n [1] |
|---|---|
| Smooth surfaces (concrete, asphalt, gravel, or bare soil) | 0.011 |
| Fallow (no residue) | 0.05 |
| Cultivated soils: | |
| Residue cover ≤20% | 0.06 |
| Residue cover >20% | 0.17 |
| Grass: | |
| Short grass prairie | 0.15 |
| Dense grasses [2] | 0.24 |
| Bermudagrass | 0.41 |
| Range (natural) | 0.13 |
| Woods:[3] | |
| Light underbrush | 0.40 |
| Dense underbrush | 0.80 |

[1] The n values are a composite of information compiled by Engman (1986).

[2] Includes species such as weeping lovegrass, bluegrass, buffalo grass, blue grama grass, and native grass mixtures.

[3] When selecting n , consider cover to a height of about 0.1 ft. This is the only part of the plant cover that will obstruct sheet flow.

For sheet flow of less than 300 feet, use Manning's kinematic solution (Overtop and Meadows 1976) to compute $T_t$:

$$T_t = \frac{0.007(nL)^{0.8}}{(P_2)^{0.5} s^{0.4}} \qquad \text{[eq. 3-3]}$$

where:

$T_t$ = travel time (hr),
n = Manning's roughness coefficient (table 3-1)
L = flow length (ft)
$P_2$ = 2-year, 24-hour rainfall (in)
s = slope of hydraulic grade line (land slope, ft/ft)

This simplified form of the Manning's kinematic solution is based on the following: (1) shallow steady uniform flow, (2) constant intensity of rainfall excess (that part of a rain available for runoff), (3) rainfall duration of 24 hours, and (4) minor effect of infiltration on travel time. Rainfall depth can be obtained from appendix B.

## Shallow concentrated flow

After a maximum of 300 feet, sheet flow usually becomes shallow concentrated flow. The average velocity for this flow can be determined from figure 3-1, in which average velocity is a function of watercourse slope and type of channel. For slopes less than 0.005 ft/ft, use equations given in appendix F for figure 3-1. Tillage can affect the direction of shallow concentrated flow. Flow may not always be directly down the watershed slope if tillage runs across the slope.

After determining average velocity in figure 3-1, use equation 3-1 to estimate travel time for the shallow concentrated flow segment.

## Open channels

Open channels are assumed to begin where surveyed cross section information has been obtained, where channels are visible on aerial photographs, or where blue lines (indicating streams) appear on United States Geological Survey (USGS) quadrangle sheets. Manning's equation or water surface profile information can be used to estimate average flow velocity. Average flow velocity is usually determined for bankfull elevation.

Manning's equation is:

$$V = \frac{1.49 r^{\frac{2}{3}} s^{\frac{1}{2}}}{n} \qquad \text{[eq. 3-4]}$$

where:

V = average velocity (ft/s)
r = hydraulic radius (ft) and is equal to $a/p_w$
a = cross sectional flow area ($ft^2$)
$p_w$ = wetted perimeter (ft)
s = slope of the hydraulic grade line (channel slope, ft/ft)
n = Manning's roughness coefficient for open channel flow.

Manning's n values for open channel flow can be obtained from standard textbooks such as Chow (1959) or Linsley et al. (1982). After average velocity is computed using equation 3-4, $T_t$ for the channel segment can be estimated using equation 3-1.

### Reservoirs or lakes

Sometimes it is necessary to estimate the velocity of flow through a reservoir or lake at the outlet of a watershed. This travel time is normally very small and can be assumed as zero.

## Limitations

- Manning's kinematic solution should not be used for sheet flow longer than 300 feet. Equation 3-3 was developed for use with the four standard rainfall intensity-duration relationships.

- In watersheds with storm sewers, carefully identify the appropriate hydraulic flow path to estimate $T_c$. Storm sewers generally handle only a small portion of a large event. The rest of the peak flow travels by streets, lawns, and so on, to the outlet. Consult a standard hydraulics textbook to determine average velocity in pipes for either pressure or nonpressure flow.

- The minimum $T_c$ used in TR-55 is 0.1 hour.

- A culvert or bridge can act as a reservoir outlet if there is significant storage behind it. The procedures in TR-55 can be used to determine the peak flow upstream of the culvert. Detailed storage routing procedures should be used to determine the outflow through the culvert.

## Example 3-1

The sketch below shows a watershed in Dyer County, northwestern Tennessee. The problem is to compute $T_c$ at the outlet of the watershed (point D). The 2-year 24-hour rainfall depth is 3.6 inches. All three types of flow occur from the hydraulically most distant point (A) to the point of interest (D). To compute $T_c$, first determine $T_t$ for each segment from the following information:

Segment AB: Sheet flow; dense grass; slope (s) = 0.01 ft/ft; and length (L) = 100 ft. Segment BC: Shallow concentrated flow; unpaved; s = 0.01 ft/ft; and L = 1,400 ft. Segment CD: Channel flow; Manning's n = .05; flow area (a) = 27 $ft^2$; wetted perimeter ($p_w$) = 28.2 ft; s = 0.005 ft/ft; and L = 7,300 ft.

See figure 3-2 for the computations made on worksheet 3.

# Lag time characteristics for small watersheds in the U.S.

M.J. Simas[1], R.H. Hawkins[2]

**Abstract**

Lag time, defined as the time from the centroid of rainfall excess to the centroid of direct runoff, was evaluated for over 50,000 rainfall-runoff events in 168 small watersheds in the United States ranging from 0.243 to 3490 acres. In most watersheds a stable value of lag time was observed for the larger storms, with peak flow the variable that best showed this tendency. The watersheds were divided into groups to explain the variation of lag time between watersheds. The groups that had a significant effect in the regression equation were geographical regions, watershed management practices, and the stability of the lag time value for the bigger storms. Separation of watersheds by land use and hydrologic behavior did not significantly improve the regression analyses. When only watersheds with stable behavior were used (N=78), no group significantly improved the regression equation, $t_{lag} = 0.0051 \times width^{0.594} \times slope^{-0.150} \times S_{nat}^{0.313}$, which exhibited $R^2$=58%.

## Introduction

Public investment in surface drainage improvements in developing urban areas involves an annual capital investment on the order of a few billion of dollars (Pilgrim and Cordery, 1993). The average annual expenditure for works in small rural drainage basins amounts to 46 percent of the total expenditure on structures and works, making

[1] Universidade Independente - Av. Marechal Gomes da Costa - 1800 Lisbon - Portugal
[2] School of Renewable Natural Resources, University of Arizona - Tucson, AZ 85721

flood estimation for these small drainage basins of great importance in terms of national expenditure.

In design flood estimation, characteristic response times are required for the determination of hydrograph parameters and critical duration of flood producing rainfall (Ward et al., 1980). A given volume of water may or may not represent a flood hazard, as the hazard will depend on the time distribution of the flood runoff. Almost all hydrologic analysis of rainfall and runoff usually require the value of at least one time parameter as input (McCuen, 1989).

Most hydrologic models require a watershed characteristic that reflects the timing of runoff. One of the most widely used methods for estimating floods on small drainage basins is the U.S. Soil Conservation Service (SCS) method. The SCS method uses lag time, defined as the time difference between the centroid of the effective rainfall and the peak of direct runoff.

There is some inconsistency in the definition of lag time, and this leads to difficulty in analyzing the results from the different models that use it. Singh (1988) gathered nine different definitions for lag time. Still another constraint in the applicability of the time parameters is the lack of diversity of data (McCuen et al., 1984), since most empirical equations were developed for urbanized areas, rather than for rural areas (Miller et al., 1995).

The accuracy of the design flood estimate is directly related to the accuracy with which an estimate of the watershed response time is made (Singh, 1988). Errors on the order of 75% in the estimation of the peak discharge can be attributed to errors in the estimated value of the time parameter (McCuen, 1989; Singh, 1988). Little is known about the accuracy of estimates of response times on ungaged watersheds. For a specified recurrence interval, a first approximation of the design flood estimate is inversely proportional to the response time (Singh, 1988). In performing hydrologic computations of runoff, a particular synthetic unit hydrograph is often selected, and as such, a particular time parameter consistent with the unit hydrograph theory adopted. However, if a unit hydrograph method is chosen and the selected time parameter is inconsistent with it, unknowingly significant errors may be introduced in runoff computations (Miller et al., 1995).

Lag time is affected by watershed and rainstorm parameters. The physiographic parameters that affect lag time are areal extent, form, slope, surface topographic characteristics, vegetation, and land use. The rainfall characteristics are intensity in time and space, rainfall duration, and direction of runoff. There are still other factors that affect lag time, like the antecedent moisture conditions, infiltration characteristics, wind velocity, and weather condition (Singh, 1988).

Lag time used in this study was defined as the time from the centroid of rainfall excess to the centroid of direct runoff. This definition has been accepted as being the most stable measure of lag time (Schultz and Lopez, 1974).

## Methodology

Lag time values were evaluated from rainfall-runoff data in over 50,000 events from 168 small watersheds in the United States. The watersheds ranged from 0.243 to 3490 acres, with periods of rainfall-runoff records from 3 to 58 years.

The data used in this study was obtained entirely from the Water Data Center maintained by the US Department of Agriculture, the Agricultural Research Service (ARS) in Beltsville, Maryland. This national archive of variable time-series readings for precipitation and runoff contains sufficient detail to reconstruct storm hydrographs and hyetographs. Textual files containing watershed descriptive information, land use and soils are published in the Hydrologic Data for Experimental Agricultural Watersheds in the United States book series.

Rainfall and runoff events were separated using GETPQ, a software developed at the University of Arizona which uses breakpoint rainfall-runoff data, and separates hydrographs using a constant baseflow separation slope. It then matches the rainfall to this hydrograph by comparing the times of occurrence of both the hydrograph and the hyetograph.

The lag time definition used in this study is the difference from the centroid of effective rainfall and the centroid of direct runoff.

Effective rainfall was defined and computed by an initial loss followed by a continuing loss rate (phi index). The phi was determined iteratively by adjusting its value until the effective rainfall hyetograph matched observed direct runoff depth. This done, the centroid of effective rainfall is computed.

Direct runoff was defined and computed as the runoff that has occurred once the baseflow has been deducted. The baseflow separation was done by using a constant baseflow separation slope (0.0002 in/hr$^2$).

The rainfall-runoff events were selected based on some pre-defined criteria. This filtering followed the approaches of Gray (1961) and Eagleson (1962) to select only those hydrographs with a single peak followed by an uninterrupted recession. All rainfall-runoff events were visually inspected. The rainfall-runoff events were discarded if the hydrographs were multi-peaked; if the hydrographs started before the hyetographs, suggesting inconsistency in the timing of rainfall and runoff data; if the hydrographs started after the hyetograph ended, because effective rainfall contributing to that runoff event cannot be computed; or if the events presented a negative lag time (the centroid of effective rainfall occurring after the centroid of runoff) suggesting that there is some inconsistency in the timing of rainfall and runoff data.

A total of 31,030 events were selected (out of 55,645) for further analysis of the 168 watersheds under study. Most of the factors described above that affect lag time were evaluated in this study. The study was separated in two parts. The first one evaluated the rainfall characteristics and how they affect lag time, and the second part evaluated how the watershed characteristics affected it.

Lag time should be a constant for all storms of a given watershed if the excess rainfall-direct runoff process was truly linear. However, some differences were observed when computing lag time from observed data (Barnes, 1959; Minshall, 1960; Gray, 1961; Eagleson, 1962; Diskin, 1964; Rastogi and Jones, 1969; Laureson, 1964; Askew, 1970).

In the present study, four rainfall-runoff characteristics were used to evaluate the variation of lag time within a watershed. These factors were degree of saturation of a watershed (Ramser, 1927) - represented by the previous 48 hour rainfall; effective

rainfall intensity (Ramser, 1927; Ragan and Duru, 1972; Singh and Agiralioglu, 1982) - defined as the average effective rainfall intensity, effective rainfall being defined as the rainfall that occurred after the hydrograph started; mean total discharge (Ramser, 1927; Barnes, 1959; Laureson, 1964; Askew, 1970) - ratio between total runoff depth and its duration; peak flow - introduced in this study as another hydrologic variable to explain the variation of lag time values within a watershed. Peak flow is represented by the maximum flow rate in a hydrograph.

Several watershed parameters were thought to be related to lag time, like for example length and slope of the catchment (Bell and Karr, 1969; Ragan and Duru, 1972). Vegetation cover seemed to be the most influential factor in the computation of lag time (Ragan and Duru; 1972). Imperviousness of a watershed was another factor that seemed to be important on lag time computation (Rao and Delleur, 1974).

The watershed variables observed in this study were watershed area (ac); watershed length (ft) - longest flow-path from the highest elevation to the watershed outlet; watershed slope - ratio between the maximum difference in elevation and the longest flow-path length; $S_{nat}$ - storage coefficient (in) used in the Curve Number (CN) method. Width (ft) is the watershed area divided by the watershed length. CN was computed using the asymptotic determination of runoff Curve Numbers from rainfall and runoff data technique (Hawkins, 1992).

Multiple linear regression analysis was performed on the data. The desired form of the fitted equation was $Lag = a_0 * width^{a_1} * slope^{a_2} * S_{nat}^{a_3}$.

The watersheds were separated into four diverse groups to clarify possible grouping relationships and give more reliable fittings. The groups represented qualitative characteristics of a watershed and were: regions (East, Midwest, Central, Southwest); land use (pasture, mixed, agriculture, forest); management (high, medium and low disturbance); behavior (Complacent, Standard, Violent) (Hawkins, 1992).

**Results and Discussion**

Variations of lag time within a watershed

Lag time was not a constant for a watershed but varied considerably. Some watersheds showed a tendency towards a constant value of lag time for the bigger storms. Unlike what is described in the literature, the degree of saturation of a watershed, represented by the prior 48-hour rainfall, showed no significant or consistent relationship to lag time. As for the effective rainfall intensity, previous studies had found that time of concentration (directly related to lag time) should decrease for the higher rainfall intensity storms (Ramser, 1927; Ragan and Duru, 1972; Agiraloglu and Singh, 1981; Singh, 1982). Such relationship was not observed in this study. A non-linear relation between lag time and mean total discharge was suggested by Askew (1970). In this study, only 5 of the 168 watersheds had a coefficient of determination ($r^2$) above 0.50 upon for such relationships.

However, some watersheds showed a tendency to a constant value of lag time at the higher values of previous 48-hour rainfall, suggesting that the scatter observed under 'drier' conditions is perhaps because of partial area contribution to runoff. The same is true for the higher intensity storms, suggesting that the watershed might not be

at equilibrium for the small storms, when the hydrology of the watershed is still not well developed. The same tendency towards a constant value of lag time at the high mean runoff rate values was found, suggesting that the hydrology of the watershed is better defined for bigger storms. Also, for bigger storms the watershed may reach steady-state conditions. The variable introduced in this study was peak flow, and similarly to the previous evaluations, lag time showed a stable value for larger peak flow values. The higher peak flow suggests bigger storms, that might be better distributed both in time and space. This might represent steady-state conditions, and the value of lag time should not be affected by the size of the storm, once these conditions are met. The best estimate of lag time was computed for each watershed.

Variations of lag time between watersheds

All variables (width, slope, $S_{nat}$) were significant in explaining the variation of lag time in regression analysis. Two sets of watersheds were evaluated, the first being all watersheds, and the second being composed of the watersheds that showed a stable value for the larger storms. For the first set, the groups that had a significant effect were geographical regions, watershed management practices, and the tendency towards a constant value of lag time for the bigger storms. Separation of watersheds by land use and hydrologic behavior did not significantly improve the regression analyses. When the second set of watersheds was used, no group significantly improved the regression equation. The final regression equation (second set) was

$$t_{lag} = 0.0051 \times width^{0.594} \times slope^{-0.150} \times S_{nat}^{0.313} .$$

This equation had $R^2$= 58, and N= 78. It bears repeating that $t_{lag}$ is in hours, *width* is in feet, *slope* is a decimal fraction, and $S_{nat}$ is in inches.

**Conclusions**

There was a tendency towards a stable value of lag time for the larger storms. Peak flow was the hydrologic variable that best showed this tendency. Hydrologic relationships previously described in the literature were not verified in this study.

In order to compute lag time rainfall-runoff data should be used, especially for the larger storms. If there is not enough data available, grouping the watersheds into regions and management practices will improve the regression equation. Width, slope and $S_{nat}$ are good variables for prediction of lag time. The model developed in this study had a higher coefficient of determination compared to other models presented in the literature.

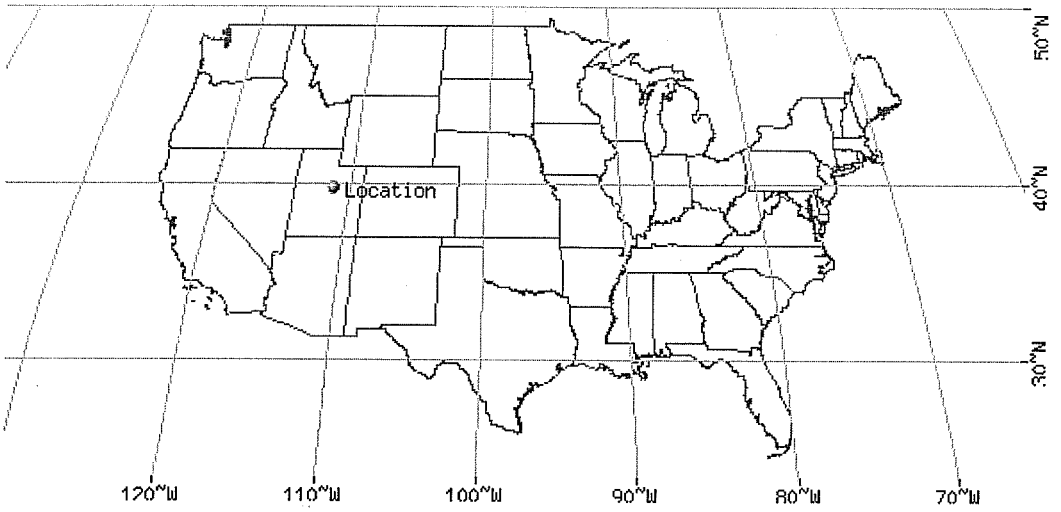
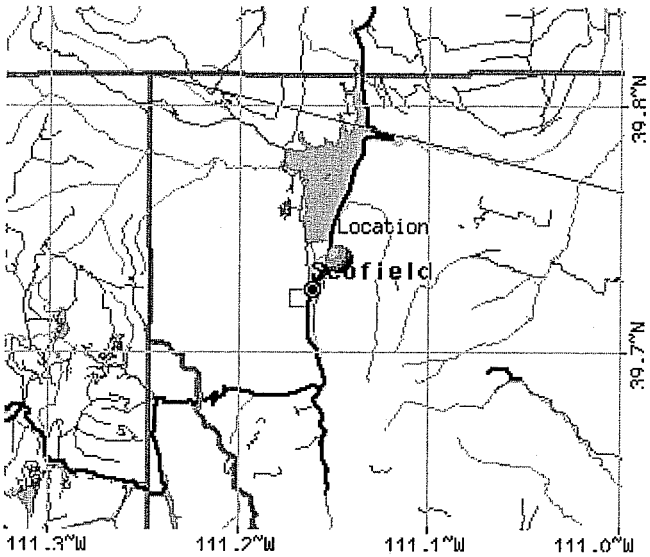
* The **lower** bound of the confidence interval at 90% confidence level is the value which 5% of the simulated quantile values for a given frequency are **less** than.

** These precipitation frequency estimates are based on a partial duration maxima series. **ARI** is the Average Recurrence Interval.
Please refer to the documentation for more information. NOTE: Formatting prevents estimates near zero to appear as zero.

## Maps -





These maps were produced using a direct map request from the U.S. Census Bureau Mapping and Cartographic Resources Tiger Map Server.

*Please read disclaimer for more information.*

## Other Maps/Photographs -

**View USGS digital orthophoto quadrangle (DOQ)** covering this location from TerraServer; **USGS Aerial Photograph** may also be available
from this site. A DOQ is a computer-generated image of an aerial photograph in which image displacement caused by terrain relief and camera tilts has been removed. It combines the image characteristics of a photograph with the geometric qualities of a map. Visit the USGS for more information.

## Watershed/Stream Flow Information -

Find the Watershed for this location using the U.S. Environmental Protection Agency's site.

## Climate Data Sources -

*Precipitation frequency results are based on data from a variety of sources, but largely NCDC. The following links provide general information*
*about observing sites in the area, regardless of if their data was used in this study. For detailed information about the stations used in this study,*
*please refer to our documentation.*

Using the **National Climatic Data Center's (NCDC)** station search engine, locate other climate stations within:

+/-30 minutes ...OR... +/-1 degree of this location (39.730247/-111.1550194). Digital ASCII data can be obtained directly from **NCDC**.

Find Natural Resources Conservation Service (NRCS) SNOTEL (SNOwpack TELemetry) stations by visiting the **Western Regional Climate Center's state-specific SNOTEL station maps**.

SCS 6 hr distribution (30 min intervals)

72 min interval

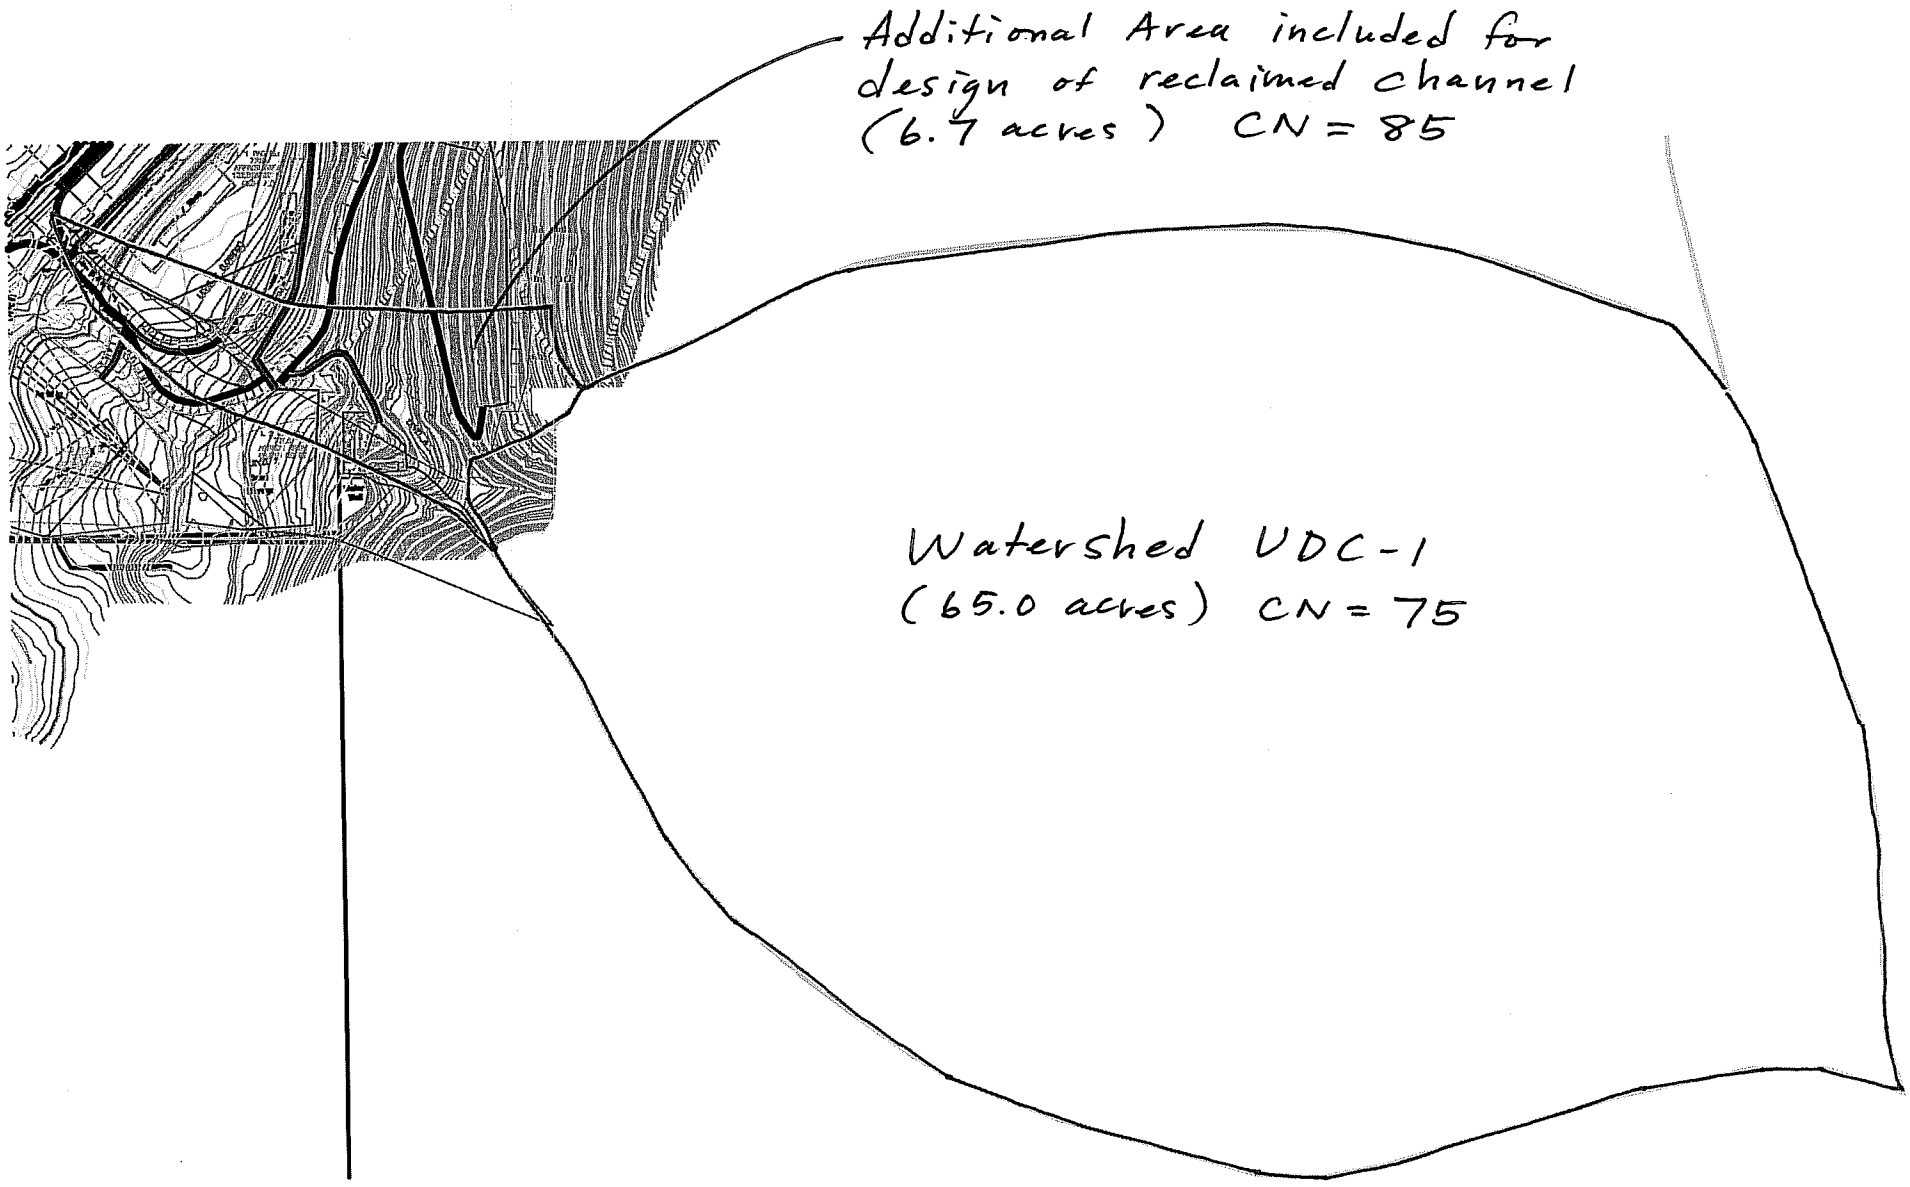
Reclaimed Channel designed for the 100yr 6hr event.

HEC-HMS analysis was performed to determine 100 yr 6hr discharge for design of the reclaimed channel.

Area weighted CN for area =

$$CN_{weighted} = \frac{(6.7\,acres)(85) + (65.0\,acres)(75)}{(6.7\,acres + 65.0\,acres)}$$

$$= \underline{\underline{76}}$$



Additional Area included for design of reclaimed channel (6.7 acres) CN = 85
Watershed UDC-1 (65.0 acres) CN = 75
N
Scale: 1" = 500'

HEC-HMS

# Project : Reclaimed Watershed-A

# Reclamation Channel Design (UDC-1)

## Design Procedure:

Estimated a D50 size of 1 feet diameter from the Chart 27 from "Design of Stable Channels with Flexible Linings" - October 1975. The D50 size was based on a slope of approximately 130% and a calculated maximum flow depth of 0.5 ft (see spreadsheet calcs).

CHECKED ____
DATE 12/20/07

UDC-1

Design flow = 14.3 cfs

(Based on the 100 yr - 6 hr event)

Based on Chart 5 in the "Hydraulic Charts for the selection of Highway Culverts," assuming HW/D = 1.0 with a projecting entrance type, D = 27.5 in, 30 used

D = 30 in

## Culvert #1 (CDC-2)

Design Flow ($Q_1$) = 9.4 cfs
(Comes from UDD1 for 100yr 6hr event)

Based on Chart 5 in the "Hydraulic Charts for the Selection of Highway Culverts," assuming $H_w/D = 1.0$ with a projecting entrance type, $D_1 = 23$ in

So use $D_1 = 24$ in

## Culvert #2 (CP-1)

$D_2 = 24$ in (Design based on overflow discharge from detention basin - see detention basin calculations)

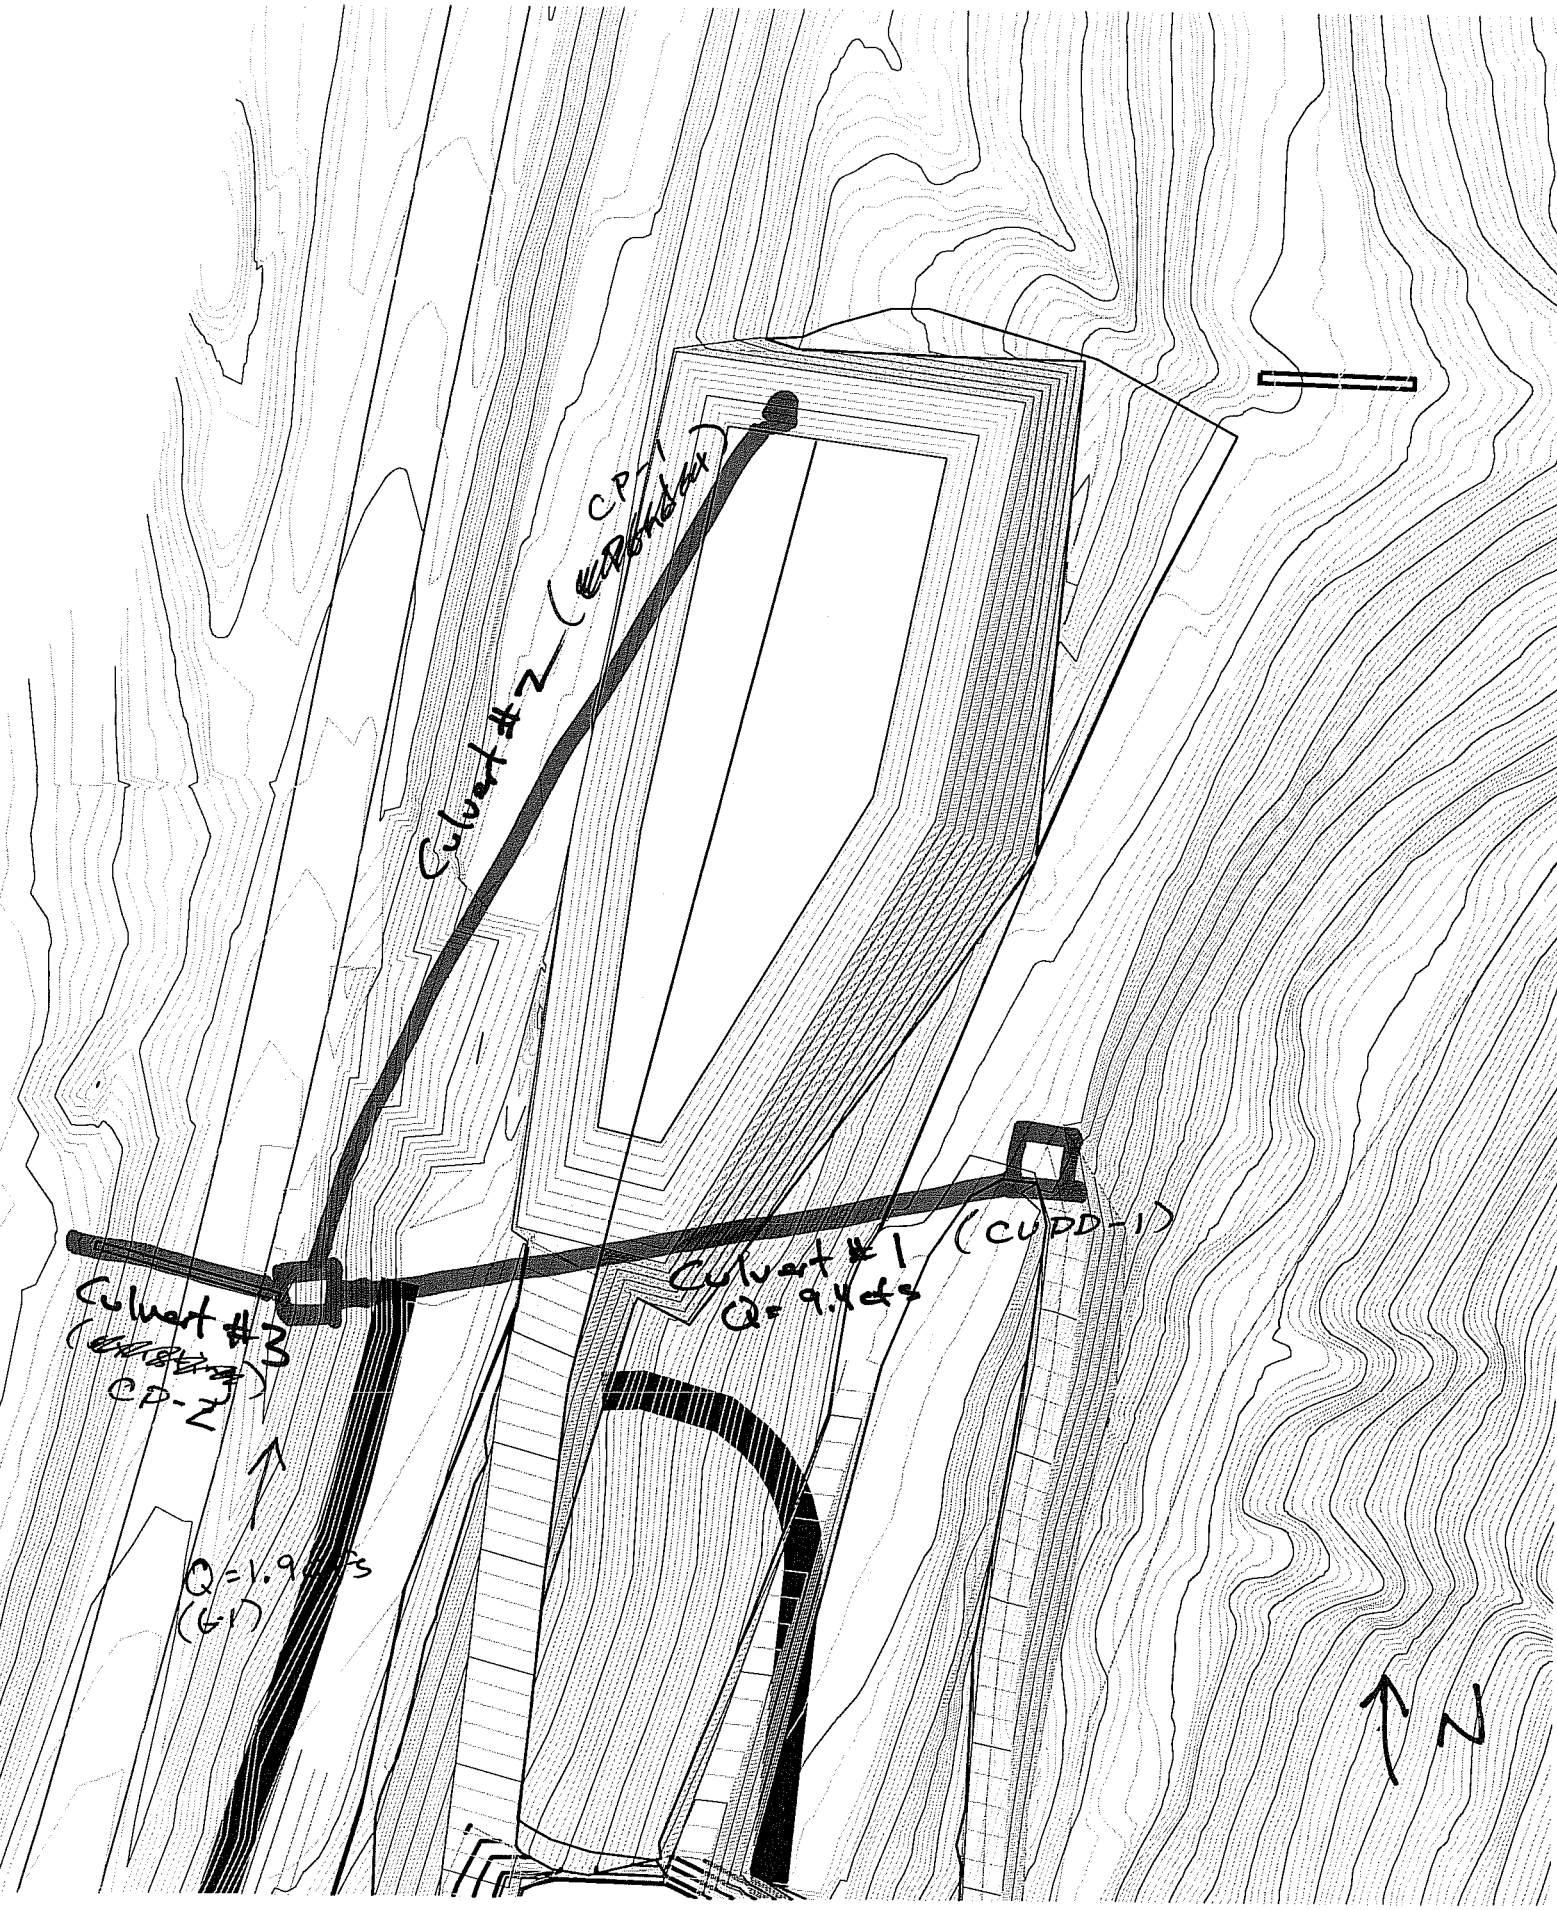
## Culvert #3 (CP-2)

Design Flow ($Q_3$) = 33.8 cfs

(Combination of flows from culvert #1 & #2, a subbasin 6-1 of, 22.5 cfs, 9.4 cfs and 1.9 cfs respectively)

Based on Chart 5 in the "Hydraulic Charts for the Selection of Highway Culverts," assuming $H_w/D = 1.0$ with a projecting entrance type, $D_3 = 42$"

There is an existing 36" diameter pipe at this location



Culvert #2

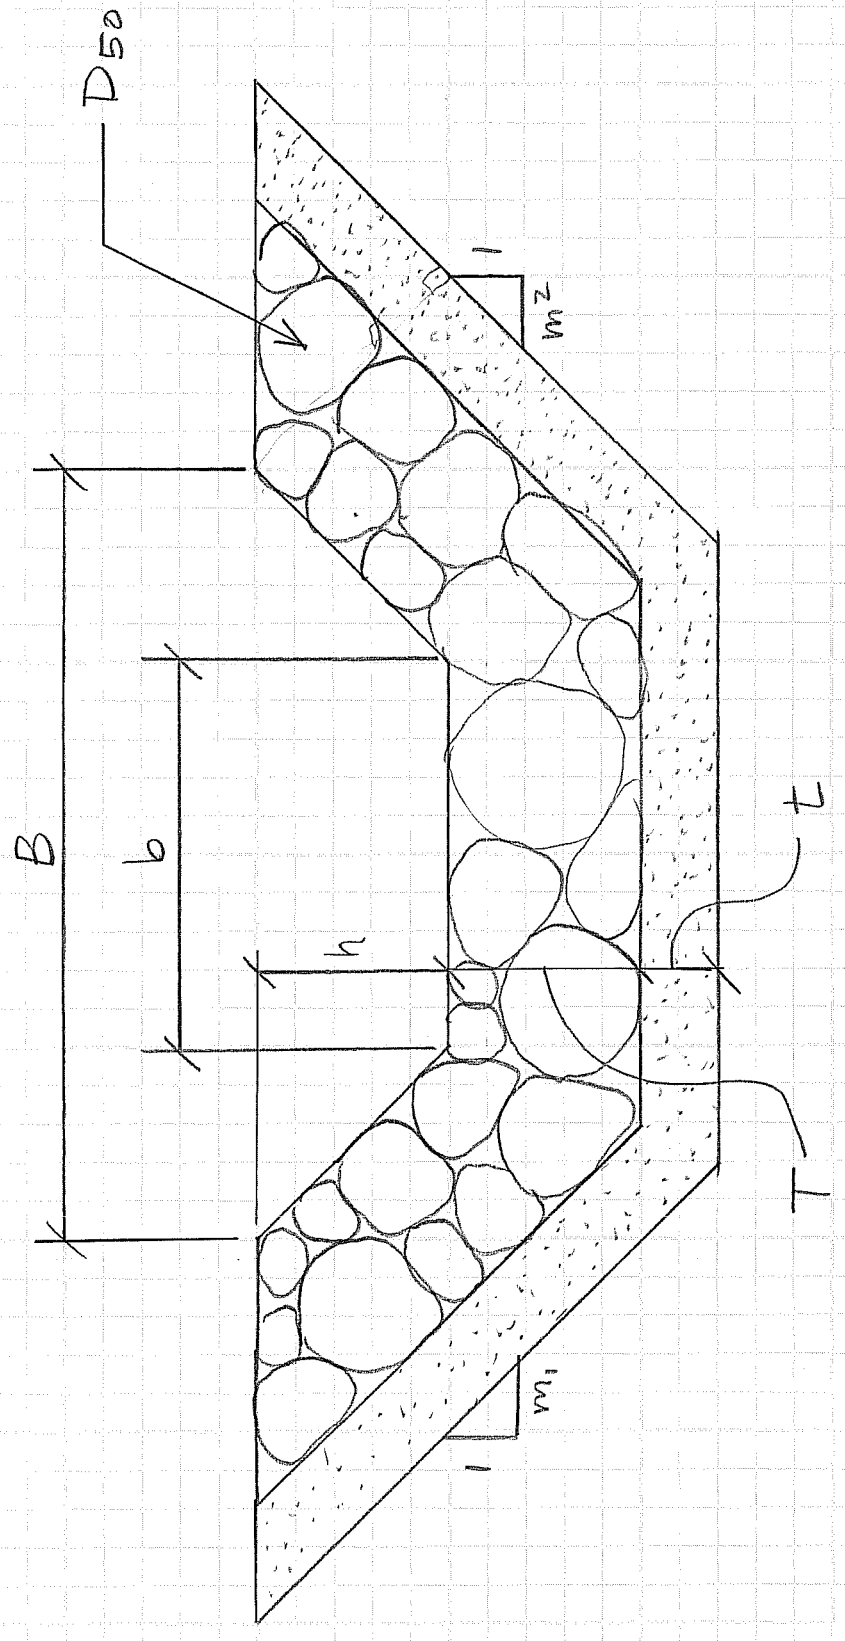
ENGINEERS

CLIENT Carbon Resources
PROJECT Kinney Mine Hydrology
FEATURE Typical Ditch Cross Section
PROJECT NO 308.01.403

SHEET ____ OF ____
COMPUTED TDS
CHECKED ____
DATE 7-3-07



# Ditch Design Procedure:

1. Determined velocities in ditch based on minimum and maximum slopes.
2. Ditches with velocities less than 4 ft/s will not require any rip-rap.
3. Ditches with velocities greater than or equal to 4 ft/s will require rip-rap.
   - (a) Estimated D50 size in order to achieve a minimum safety factor of 1.5.
   - (b) If D50 size was an unreasonable size for the associated ditch, the D50 size was determined to be 0.25 ft (diameter) and the ditch will need to be grouted. (This was the case for all ditches with velocities greater than 4 ft/s)

* Sizing details for each ditch are shown in "Ditch Design Details" spreadsheet.

| | | |
|---|---|---|
| d | = | Depth of flow; |
| S | = | Channel slope in feet per feet; |
| SG | = | Specific gravity of rock, and |
| $D_{50}$ | = | Mean riprap size, in feet. |

An analysis of side slope stability was completed by applying equations 784.14-12 through 784.14-14.

$$SF = \frac{\cos \alpha \tan \phi}{\eta' \tan \phi + \sin \alpha \cos \beta} \qquad (742.312\text{-}12)$$

$$\beta = \arctan \left( \frac{\cos \theta}{\frac{2 \sin \alpha}{\eta \tan \phi} + \sin \theta} \right) \qquad (742.312\text{-}13)$$

$$\eta' = C \eta \left( \frac{1 + \sin (\theta + \beta)}{2} \right) \qquad (742.312\text{-}14)$$

where

| | | |
|---|---|---|
| $\alpha$ | = | $Tan^{-1}$ (1/sideslope); and |
| C | = | 0.76 for 2H:1V sideslopes |
| | = | 0.86 for 3H:1V sideslopes. |

Sideslope is defined as the number of feet horizontal per foot vertical of the channel embankments. All other variables are as previously defined.

Once mean riprap size is determined, a riprap gradation and thickness must be determined. Table 742.312a, Recommended Riprap Gradation Limits, shows the recommended gradation for both mild and steep channel conditions. In some cases, grout was used in riprapped sections to increase channel stability and/or reduce riprap size.

**Conveyor Lining.** A second type of channel lining utilized consists of overlapped conveyor belt material. This lining was installed in excavated channels in short pieces so that the upstream belt material overlapped the downstream piece thereby preventing water from washing beneath the downstream liner. Each section of channel lining was secured with wire and rebar anchors. The locations of lined channel sections are shown on Maps 731.720a through 731.720c.

TABLE 742.312a
Recommended Riprap Gradation Limits

| DESIGN RATIO | STEEP SLOPE | MILD SLOPE |
|---|---|---|
| $\frac{D_{max}}{D_{50}}$ | 1.25 | 2 |
| $\frac{D_{50}}{D_{10-20}}$ | 2-3 | 2-3 |

From "Surface Mining Water Diversion Design Manual", 1982

**Half Round CMP Pipe.** In other locations such as around Ponds 4 and 6, half round CMP pipe has been placed to provide the required erosion protection. CMP pipe has also been used in steep areas where channel flow is infeasible but yet the water must be conveyed down a hillside. Examples of such areas are noted near the upper mine portals and along the roadway leading to the upper mine offices located on the Lion Deck.

Ditch sections requiring erosion protection are shown on Maps 731.720a through 731.720c. Areas downstream from culvert installations requiring similar protection are shown on Maps 731.720d through 731.720f. Specific mention should be made with regard to the design of erosion protection at some of the locations shown on the maps. Current riprap design methodologies do not allow for the design of erosion protection on extremely steep slopes using such materials as rock riprap. In some locations, however, such as at Culverts 57A through 60A (as well as at other locations within the mine permit area), consideration must be given to the fact that local drainage must be transferred down a steep hillside or stream channel. At such locations, procedures are not available for designing riprap erosion protection and, therefore, calculations under such conditions have not been, nor can they be made.

An effort has been made by CPMC to reduce or eliminate the potential for serious erosion at these locations by placing culvert exits onto existing or man-made rock rubble piles, or onto rock ledges which act as energy dissipation devices and effectively reduce downstream erosion. CPMC will continue to monitor culvert outfalls at these locations and thereby determine the efficiency of the rock rubble piles and what additional action, if any, should or can be taken.

Conditions related to lining of individual ditches are shown on Maps 731.720a through 731.720c. Conditions related to culvert outfall linings are shown on Maps 731.720d through 731.720f. Channel and Culvert riprap calculations are presented in Exhibit 742.312a, Riprap Calculations.

**Culvert Design.**

Following the determination of a given peak watershed discharge, design sizes for culverts were calculated as part of the runoff diversion and conveyance facilities. Flow capacity calculations were made

In the design of riprap-lined channels, National Cooperative Highway Research Program Report No. 108, "Tentative Design Procedure for Riprap-Lined Channels"[10] details the procedure for determining a design stone size such that the stone is stable under the design flow conditions with a reasonable factor of safety. The design stone size used is the $d_{50}$, or median stone diameter, defined as that stone size which is exceeded in weight by 50 percent of the mixture.

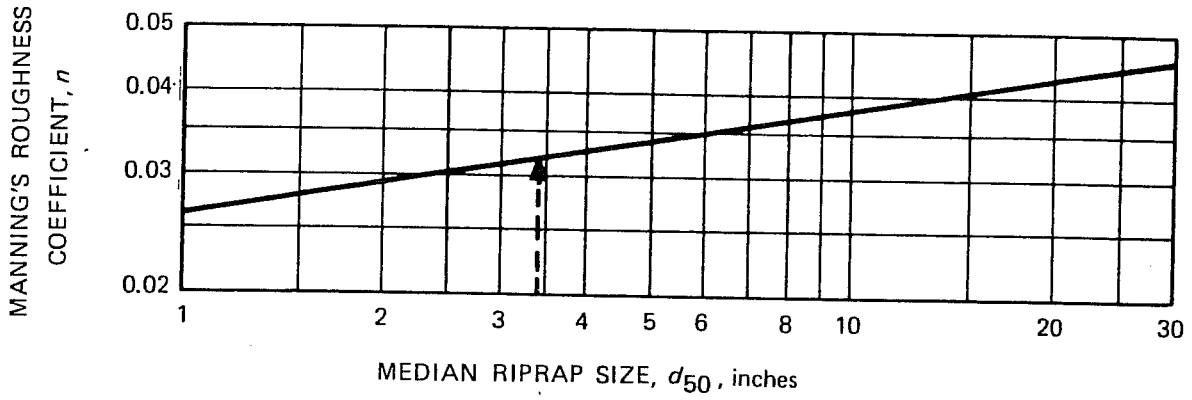

Figure I-17. Manning's $n$ for riprap-lined channels.[1]

Erosive forces of flowing water are greater in bends than in straight channels. Therefore, riprap size for bends and straights in the channel must be computed. If the riprap size ($d_{50}$) computed for bends is less than 10 percent greater than the riprap size for straight channels, then the riprap size for straight channels shall be considered to be of adequate size; otherwise, the larger riprap size shall be used in the bend. This is done in order to minimize the number of riprap sizes required. No more than two riprap sizes should be used on any single contract, in order to minimize construction problems caused by too many sizes. The riprap size to be used in a bend shall extend upstream from the point of curvature, and downstream from the point of tangency a distance equal to five times the channel bottom width (length = 5 $b$). This riprap size shall extend across the bottom and up both sides of the channel.

### Riprap

The riprap shall be composed of a well-graded mixture down to the 1-inch size particle, such that 50 percent of the mixture by weight shall be larger than the $d_{50}$ size. A well-graded mixture is defined as a mixture composed primarily of the larger stone sizes but with a sufficient mixture of other sizes to fill the progressively-smaller voids between the stones. The diameter of the largest stone size in such a mixture shall be considered to be 1.5 times the $d_{50}$ size. The riprap size as shown on the plans and specifications or for other construction purposes shall be the size of the largest stone in the mixture, i.e., 1.5 x $d_{50}$. The minimum thickness of the riprap layer shall be 1.5 times the maximum stone diameter but not less than 6 inches. The riprap shall extend up the banks to a height equal to maximum depth of flow or to a point where vegetation can be established to adequately protect the channel.

Ref: "Erosion and Sediment Control
Surface Mining in the Eastern U.S"
EPA Technology Transfer Seminar Publication
October 1976

In channels where there is no riprap or paving in the bottom, the toe of the bank riprap shall extend below the channel bottom a distance at least 1.5 times the maximum stone size, but in no case less than 1 foot. The only exception to this would be in the event that there is a non-erodible hard rock bottom. The channel bank shall not be steeper than 2.0 horizontal to 1.0 vertical.

After determining the riprap size that will be stable under the flow conditions, the designer shall consider that size to be a minimum size and then, based on riprap graduations actually available in the area, shall select the size or sizes that equal or exceed the minimum size. The possibility of damage by children shall be considered in selecting a riprap size, especially if there is nearby water to to toss the stones into.

### Filter

A filter is a layer of material placed between the riprap and the underlying soil surface to prevent soil movement into and through the riprap.

Riprap shall have a filter placed under it when either of the following conditions exist:

1. The riprap is not well graded down to the 1-inch size particle.

2. Riprap is placed on the side slopes of a channel and the soil is sand-size or finer with a plasticity index, *PI*, less than 10. This requirement applies to slopes having this soil in lenses or layers greater than 3 inches in thickness.

A filter can be of two general forms. One is a single layer of plastic filter cloth manufactured for that express purpose. The plastic filter cloth shall be woven of polypropylene monofilament yarns and shall be equivalent to "Poly-Filter X" as manufactured by Carthage Mills, Inc., Cincinnati, Ohio. Another is a properly graded layer of sand, gravel, or stone.

The criteria for the design of an aggregate filter are as follows:

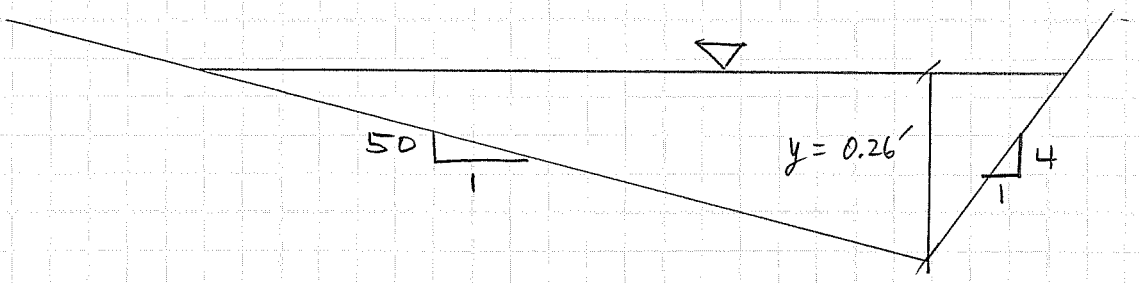
$$\frac{d_{15}\ \text{Riprap}}{d_{85}\ \text{Filter}} \leqslant 5 \qquad \frac{d_{15}\ \text{Filter}}{d_{85}\ \text{Base}} \leqslant 5$$

in which $d_{15}$ or $d_{85}$ is the size of base, filter or riprap material. In these equations, 15 and 85 percent, respectively, are finer. The base is the soil layer underneath the filter. The filter shall be graded down to sand-size particles. Riprap 12 inches and larger shall not be dumped directly onto the plastic filter cloth, since it may tear or displace the filter cloth. Instead, a 4-inch-minimum thickness blanket of gravel shall be placed over the filter cloth or the riprap shall be placed directly on the filter cloth by hand or by the bucket of the equipment. Side slopes shall be 2:1 or flatter to prevent the gravel from sliding down the filter cloth before placing the riprap.

### Soil Size Classification

Soil sizes given herein are according to the Unified Soil Classification System as shown on the following page.

Road / Ditch design to contain 100 yr 6hr discharge of 9.4 cfs.



Road w/ these minimum dimensions will pass the 100yr 6hr event of 9.4 cfs.

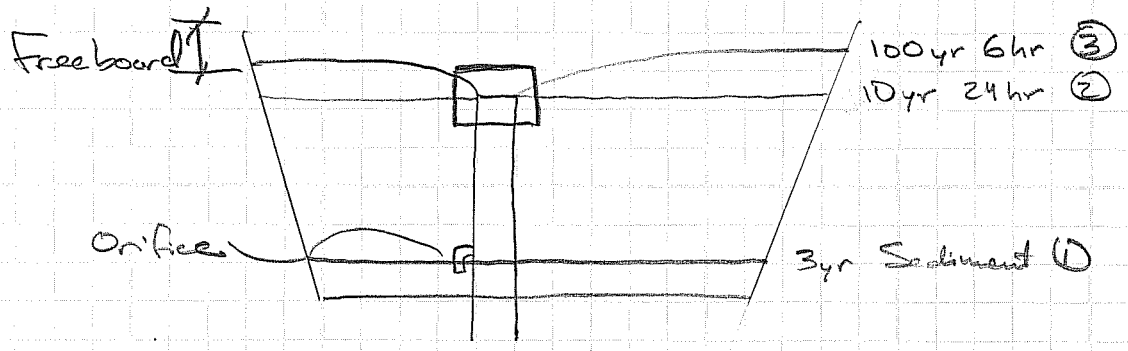
# Sediment / Detention Volumes



## (1) 3yr Sediment Volume

$A = (R)(K)(LS)(C)(P)$ → Universal Soil Loss Equation (USLE)

where:

A = Soil loss (tons/acre/yr)
R = Rainfall factor (ft-tons/acre/hr)
K = Soil Erodibility Factor
LS = Topographic factor
C = Cover or cropping management factor
P = Erosion control Practice factor

Values of R and K were determined from Clyde et al. (1978)

R = 22.0 tons/acre/yr ←

K = 0.28 tons/acre/yr/unit of R ←

$$LS = \frac{(650 + 450S + 65S^2)(L/72.6)^m}{10{,}000 + S^2}$$

where:

L = average overland flow length (ft)
S = Slope (%)
m = exponent dependant upon steepness of slope

m = 0.3 for S < .5%, m = 0.5 for 0.5% < S < 10%

m = 0.6 for S > 10%

# L & S Calculations

| Subbasin | L (ft) | S (%) |
|---|---|---|
| SB L 1.5 | 640 | 2.0 |
| SB L 2 | 1840 | 9.5 |
| SB L 3 | 830 | 20.7 |
| SB Access A | 560 | 9.3 |
| SB L 1 | 840 | 0.9 |
| SB Access B | 520 | 2.8 |
| SB L 5 | 1540 | 7.2 |
| SB L 2.5 | 800 | 14.2 |
| SB L .75 | 1250 | 4.2 |
| SB Ditch B | 1310 | 2.4 |
| SB Ditch A | 590 | 4.4 |
| SB Pond | 610 | 9.1 |
| Average | 944 | 7.2 |

$$LS = \frac{(650 + 450(7.2) + 65(7.2)^2)\left(944\ ft / 72.6\right)^{0.5}}{10{,}000 + (7.2)^2}$$

$$= 2.6 \leftarrow$$

Values of C and P were determined from the U.S. Soil Conservation Service (1977)

C = 1.0 (for disturbed)

P = 1.0

$$A = (R)(K)(LS)(C)(P)$$

$$= (22.0\ tons/acre/yr)(0.28\ tons/acre/yr/Unit\ of\ R)(2.6)(1.0)(1.0)$$

$$= 16.0\ tons/acre/yr$$

Sediment density of 75 lb/ft$^3$ was used in conjunction with the USLE to determine volume of reservoir sediment storage required.

Pond is designed so that sediment will be removed when the sediment volume reaches 60% of accumulated sediment storage volume.

$$A(0.6) = 16.0 \text{ tons/acre/yr } (0.6)$$

$$= 9.6 \text{ tons/acre/yr}$$

$$\forall \text{ (ac-ft/ac/yr)} = \frac{A}{\gamma_{sediment}}$$

$$= \frac{(9.6 \text{ tons/acre/yr})\left(\frac{2000 \text{ lb}}{1 \text{ ton}}\right)}{75 \text{ lb/ft}^3 \left(\frac{43{,}560 \text{ ft}^3}{1 \text{ acre-ft}}\right)}$$

$$= 0.00588 \text{ acre-ft/acre/yr}$$

$$\forall \text{ (3 yrs)} = (0.00588 \text{ acre-ft/acre/yr})(3 \text{ yr})(36.3 \text{ ac})$$

$$= \underline{0.64 \text{ acre-ft}}$$

(2) 10 yr 24 hr Volume was determined from spreadsheet calculations.

$$V_{10yr\text{-}24hr} = \underline{2.06\ ac\text{-}ft}$$

- The orifice was sized to drain the 10yr 24hr runoff volume over a 24 hr period. See Spreadsheet

$$D_{orifice} = \underline{6.2\ in}$$

(3) Volume in the detent basin required to pass the 100 yr 6hr flow is based on the heigth required to pass the flow (22.5 $ft^3/s$). Volume of 1.67 ac-ft is required above 10yr 24hr volume. (Cumulative volume selected from stage-volume Spreadsheet)

- h required above 10yr 24hr depth to pass the 100yr 6hr flow

$$Q_{100yr6hr} = 22.5\ ft^3/s \text{ (from HMS model)}$$

$$Q = C_d A \sqrt{2gh}$$

$$= C_d \left(\frac{\pi d^2}{4}\right) \sqrt{2gh}$$

$d = 24$ in
$C_d = 0.62$
$g = 32.2\ ft/s^2$
$h = ?$

$$h = \frac{\left[\dfrac{Q}{C_d\left(\frac{\pi d^2}{4}\right)}\right]^2}{2g}$$

$$= \frac{\left[\dfrac{22.5\ ft^3/s}{0.62\left(\frac{\pi(2\ ft)^2}{4}\right)}\right]^2}{2(32.2\ ft/s^2)} = 2.1\ ft$$

Orifice Sizing to Drain 10-yr 24-hr Volume Over a 24 hour Period

V initial = 2.67 ac-ft (10-yr 24-hr + 3yr sediment volume)
116305 ft3

Orifice Design Parameters
D = 6.2 in
Cd = 0.62
Heigth to center of orifice above pond bottom = 1.60 ft (top of 3yr sediment volume + orifice diameter/2)

| 7 | 0.04 | 0.04 | 0.63 | 0.58 | Pond Adequate |
| 8 | 1.1 | 1.1 | 2.77 | 2.20 | Pond Adequate |
| 9 | 2.02 | 1.98 | 4.50 | 4.45 | Pond Adequate |

Note: Pond No. 1 is classified as a treatment facility and not a sedimentation pond.

The sediment ponds and treatment facility were designed (where possible) to contain the accumulated sediment volume from a three-year period and to prevent short circuiting. The amount of sediment to be yielded to the sedimentation ponds was determined from the Universal Soil Loss Equation (USLE) (Clyde et al., 1978, and U. S. Soil Conservation Service, 1977). In accordance with this equation, soil erosion caused by water is determined from

$$A = R*K*LS*C*P \qquad (742\text{-}2)$$

where:

A = computed amount of soil loss, in tons/acre/year;
R = rainfall factor, in foot-tons/acre/hour;
K = soil erodibility factor, in tons/acre/year/unit of R;
LS = topographic factor (length and steepness of slope), dimensionless;
C = cover or cropping management factor, dimensionless; and
P = erosion control practice factor, dimensionless.

Values for R and K were determined from Clyde et al. (1978). The topographic factor (LS) was determined from

$$LS = \frac{(650 + 450\,S + 65\,S^2)\,(L/72.6)^m}{10,000 + S^2} \qquad (742\text{-}3)$$

where:

L = average overland flow length, in feet;
S = average steepness of slope, in percent; and
m = an exponent dependent upon the steepness of slope (0.3 for slopes less than 0.5%, 0.5 for slopes 0.51% to 10%, and 0.6 for slopes greater than 10%).

The average overland flow length (L) was determined from Williams and Berndt (1972) as defined by the equation

$$L = \frac{0.5\ DA}{LCH} \qquad (742\text{-}4)$$

where:

DA = drainage area, in square feet; and
LCH = total length of channels in the watershed, in feet.

Values for C and P were determined from the U. S. Soil Conservation Service (1977).

A sediment density of 75 lb/ft$^3$ was used in conjunction with the USLE to determine the volume of reservoir sediment storage required. This value was obtained based upon on-site soil surveys (see Section 200 for more soils related information) which show that local soils consist mostly of a mixture of silty clayey sands. Sands commonly have unit weights in the order of 85-100 pcf based upon ASCE findings (see Sedimentation Engineering - ASCE M & R No. 54) with values more commonly used in the order of 95 pcf. Other references confirm this and indicate that silts and clays usually have lower unit weights, but at times do range from 27 to 100 pcf. Because local soil complexes do contain substantial quantities of silts and clays, a more conservative sediment density of 75 pcf was chosen as the appropriate value to use for calculation of sediment volume.

The ponds have been designed so that sediment will be removed when the sediment volume reaches 60 percent of the accumulated sediment storage volume. All sediments will be disposed of in the washed coal refuse pile. Sediment yield parameters and the accumulated sediment volume for each pond (including Treatment Facility No. 1) are contained in Table 742.221b, Sediment Design Parameters for Sediment Ponds 1 through 9.

**TABLE 742.221b**
**Sediment Design Parameters for Sediment Ponds 1 through 9.**

# Energy Dissipation Structures

Design of rip-rap apron for outlets of ICP-2 and UDC-1 using Drainage Criteria Manual (V.2)

| | Pipe Size (in) | Design Flow (cfs) | |
|---|---|---|---|
| CP-2 | 42 | 33.8 | |
| UDC-1 | 30 | 14.3 + 1 cfs = 15.3 cfs | (Assumed minimal irrigation pipe) |

Design of rip-rap apron completed for both throughout:

$$Q_{full} = \frac{1.49}{n} A_{full} (R_{full})^{2/3} (S_o)^{1/2}$$

$n = 0.024$ (Ref: Civil Engineering Reference Manual, 2006)

$$A_{full} = \frac{\pi D^2}{4}$$

$$= \frac{\pi \left(\frac{42\ in}{12\ in}\right)^2}{4} = 9.6211\ ft^2 \quad (4.9087\ ft^2)$$

$$R_{full} = \frac{D}{4} = \frac{\left(\frac{42\ in}{12\ in}\right)}{4} = 0.875\ ft \quad (0.625\ ft)$$

$$S_o = \frac{(7667.61\ ft - 7655.45\ ft)}{74.1\ ft} = 0.1641\ ft/ft \quad (0.0761\ ft/ft)$$

$$Q_{full} = \frac{1.49}{0.024} (9.6211\ ft^2)(0.875\ ft)^{2/3} (0.1641\ ft/ft)^{1/2}$$

$$= 221.357\ ft^3/s \quad (61.455\ ft^3/s)$$

$$V_{full} = \frac{Q_{full}}{A_{full}} = \frac{221.357\ ft^3/s}{9.6211\ ft^2} = 23.01\ ft/s \quad (12.52\ ft/s)$$

$Q_{design}$ (see culvert design calcs) = 33.8 $ft^3/s$ (15.3 $ft^3/s$)

$$\frac{Q_{design}}{Q_{full}} = \frac{33.8\ ft^3/s}{221.357\ ft^3/s} = 0.153\ (0.249)$$

Using Figure HS-18b $\frac{d}{D} = 0.30$ (0.38)

using Figure HS-19 $\frac{d}{D} = 0.42$ (0.435)

$$\frac{Q_{design}}{D^{2.5}} = \frac{33.8\ ft^3/s}{(3.5\ ft)^{2.5}} = 1.47\ (1.55)$$

Using Figure HS-18b: $\frac{A}{A_{full}} = 0.25\ (0.35)$

$$A = \left(\frac{A}{A_{full}}\right) A_{full}$$

$$= (0.25)(9.6211\ ft^2) = 2.4053\ ft^2\ (1.7180\ ft^2)$$

$$V_{design} = \frac{Q_{design}}{A}$$

$$= \frac{33.8\ ft^3/s}{2.4053\ ft^2} = 14.05\ ft/s\ (8.91\ ft/s)$$

$$P_d = (V^2 + gd)^{1/2} \quad (HS-16)$$

$V = 14.05\ ft/s\ (8.91\ ft/s)$
$g = 32.2\ ft/s^2$
$d = 1.05\ ft\ (0.95)$

$$\frac{d}{D} = 0.3\ (0.38)$$

$d = 0.3\ (3.5\ ft) = 1.05\ ft\ (0.95)$

$$P_d = \left[ (14.05 \text{ ft/s})^2 + (32.2 \text{ ft/s}^2)(1.05 \text{ ft}) \right]^{1/2}$$

$$= 15.21 \text{ ft/s}$$

$$(10.49 \text{ ft/s})$$

* Based on the 42-inch pipe and a $P_d$ of 15.21 ft/s, rip-rap type L should be used.

$\rightarrow D_{50} =$ 9 inches (0.75 ft)

* Based on the 30-inch pipe and a $P_d$ of 10.49 ft/s, rip-rap type L should be used.

$\rightarrow D_{50} =$ 9 inches (0.75 ft)

$$T = 1.75 (D_{50})$$

$$= 1.75 (0.75 \text{ ft}) = 1.31 \text{ ft} \ (1.31 \text{ ft})$$

$$L = 4 D$$

$$= 4 (3.5 \text{ ft}) = 14 \text{ ft} \ (10 \text{ ft})$$

$$L = (D)^{1/2} \left( \frac{V}{2} \right)$$

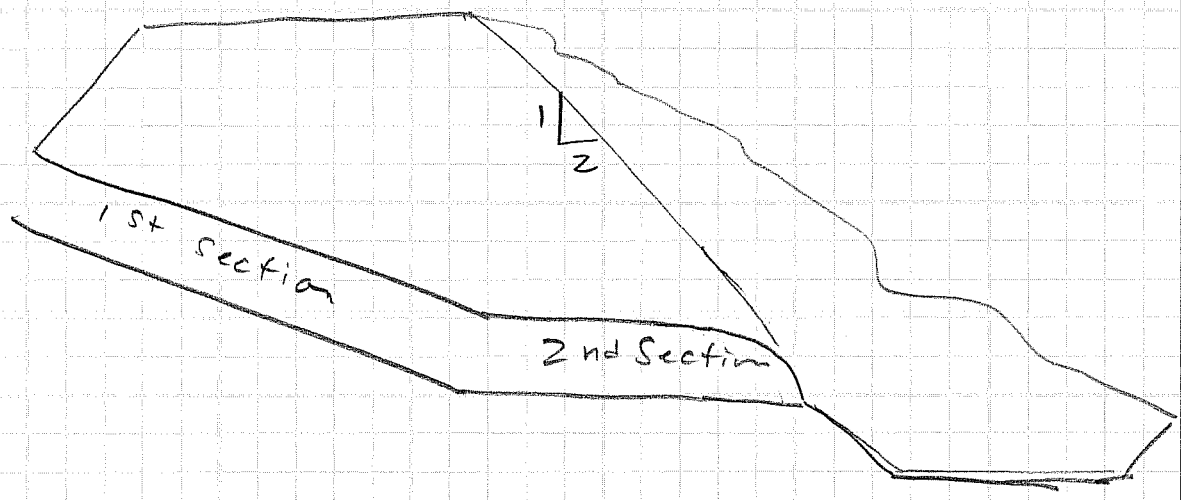
$$= (3.5 \text{ ft})^{1/2} \left( \frac{14.05 \text{ ft/s}}{2} \right) = 8.90 \text{ ft} \ (7.04 \text{ ft})$$

$$L = 14 \text{ ft} \ (10 \text{ ft})$$

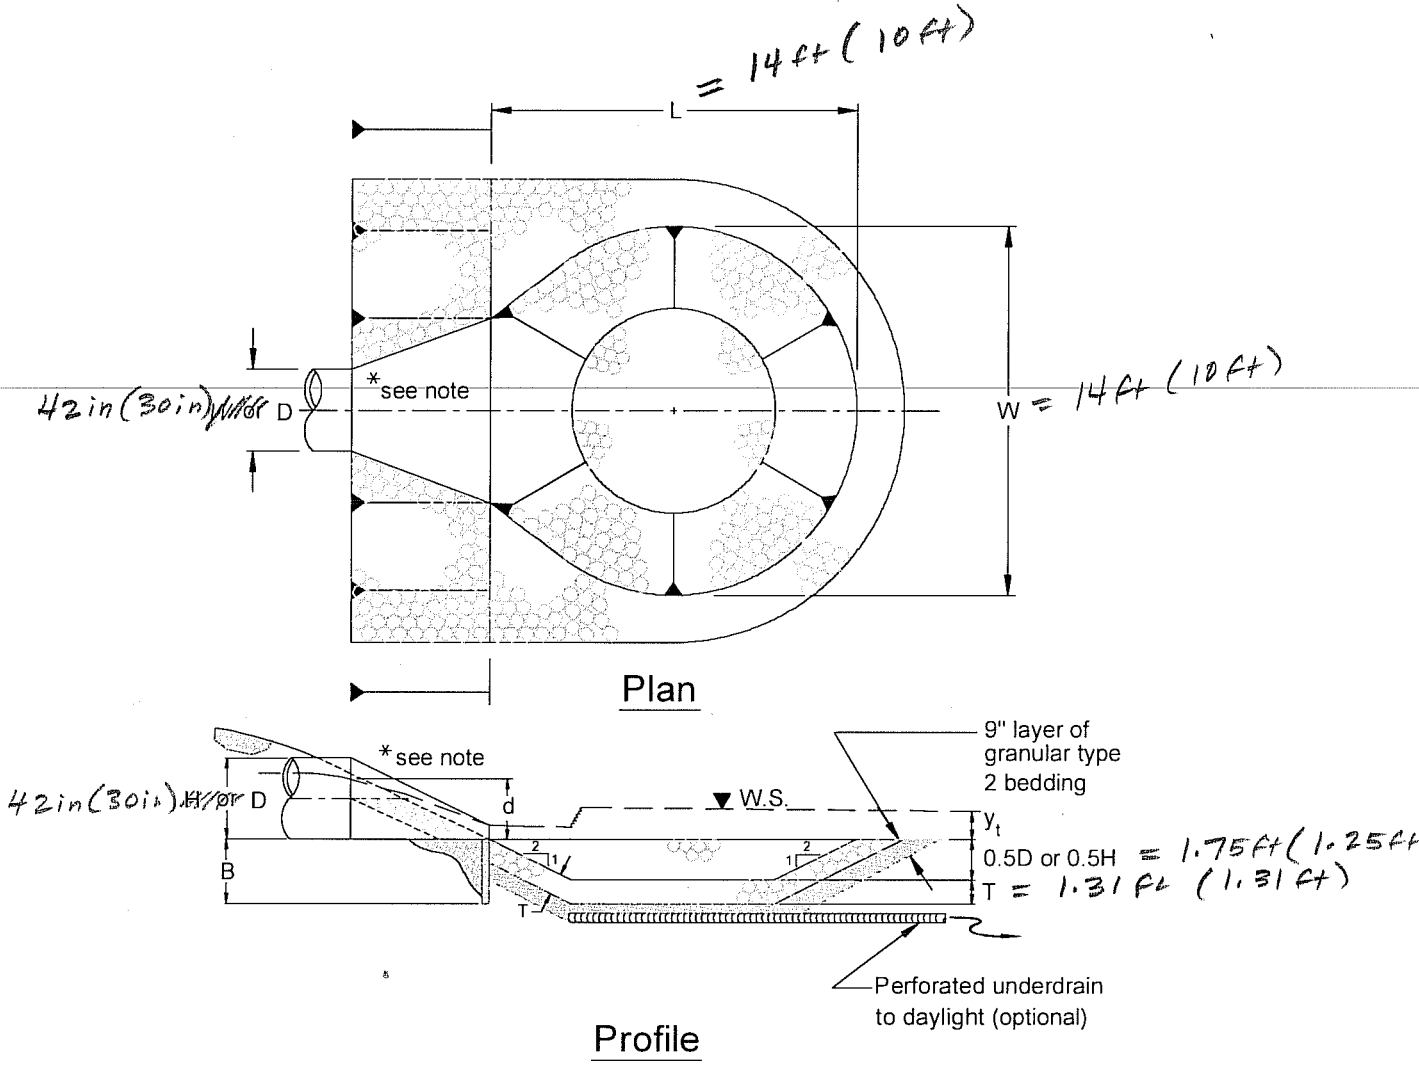
$$W = 4 D$$

$$= 4 (3.5 \text{ ft}) = 14 \text{ ft} \ (10 \text{ ft})$$

- Refer to page HS-76 for typical rip-rap apron outlet.
- In order to maintain the flat bottom for the rip-rap apron, a change in grade of the outlet pipes may require a deflection when going under the highway (see drawing). The second section of pipe should be installed with a slope of 0.16 ft/ft (CP-2) and 0.08 ft/ft (UDC-1) or less.



SPECIAL NOTE:
ENERGY DISSIPATION POOL WILL BE COORDINATED WITH UDOT. IF INSUFFICIENT ROW CAN BE UTILIZED FOR CONSTRUCTION, AN ALTERNATIVE WILL BE WORKED OUT WHEREIN A CONCRETE ENERGY DISSIPATION DEVICE CAN BE USED TO MINIMIZE REQUIRED AREA.



* Note: For rectangular conduits use a standard design for a headwall with wingwalls, paved bottom between the wingwalls, with an end cutoff wall extending to a minimum depth equal to B

## APPENDIX 17.F
Corrugated Metal Pipe

*Corrugated metal pipe* (CMP, also known as *corrugated steel pipe*) is frequently used for culverts. Pipe is made from corrugated sheets of galvanized steel that are rolled and riveted together along a longitudinal seam. Aluminized steel may also be used in certain ranges of soil pH. Standard round pipe diameters range from 8 to 96 in (200 to 2450 mm). Metric dimensions of standard diameters are usually rounded to the nearest 25 or 50 mm (e.g., a 42 in culvert would be specified as a 1050 mm culvert, not 1067 mm).

Larger and noncircular culverts can be created out of curved steel plate. Standard section lengths are 10 to 20 ft (3 to 6 m). Though most corrugations are transverse (i.e., annular), helical corrugations are also used. Metal gages of 8, 10, 12, 14, and 16 are commonly used, depending on the depth of burial.

The most common corrugated steel pipe has transverse corrugations that are 1/2 in (13 mm) deep and 2 2/3 in (68 mm) from crest to crest. These are referred to as "2 1/2 inch" or "68 × 13" corrugations. For larger culverts, corrugations with a 2 in (25 mm) depth and 3, 5, and 6 in (76, 125, or 152 mm) pitches are used. Plate-based products using 6 in by 2 in (152 mm by 51 mm) corrugations are known as *structural plate corrugated steel pipe* (SPCSP) and *multiplate* after the trade-named product "Multi-Plate™."

The flow area for circular culverts is based on the nominal culvert diameter, regardless of the gage of the plate metal used to construct the pipe. Flow area is calculated to (at most) three significant digits.

A Hazen-Williams coefficient, $C$, of 60 is typically used with all sizes of corrugated pipe. Values of $C$ and Manning's constant, $n$, for corrugated pipe are generally not affected by age. *Design Charts for Open Channel Flow* (U.S. Department of Transportation, 1979) recommends a Manning constant of $n = 0.024$ for all cases. The U.S. Department of the Interior recommends the following values. For standard (2 2/3 in by 1/2 in or 68 mm by 13 mm) corrugated pipe with the diameters given: 12 in (457 mm), 0.027; 24 in (610 mm), 0.025; 36 to 48 in (914 to 1219 mm), 0.024; 60 to 84 in (1524 to 2134 mm), 0.023; 96 in (2438 mm), 0.022. For (6 in by 2 in or 152 mm by 51 mm) multiplate construction with the diameters given: 5 to 6 ft (1.5 to 1.8 m), 0.034; 7 to 8 ft (2.1 to 2.4 m), 0.33; 9 to 11 ft (2.7 to 3.3 m), 0.32; 12 to 13 ft (3.6 to 3.9 m), 0.31; 14 to 15 (4.2 to 4.5 m), 0.030; 16 to 18 ft (4.8 to 5.4 m), 0.029; 19 to 20 ft (5.8 to 6.0 m), 0.028; 21 to 22 ft (6.3 to 6.6 m), 0.027.

If the inside of the corrugated pipe has been asphalted completely smooth 360° circumferentially, Manning's $n$ ranges from 0.009 to 0.011. For culverts with 40% asphalted inverts, $n = 0.019$. For other percentages of paved invert, the resulting value is proportional to the percentage and the values normally corresponding to that diameter pipe. For field-bolted corrugated metal pipe arches, $n = 0.025$.

It is also possible to calculate the Darcy friction loss if the corrugation depth, 0.5 in (13 mm) for standard corrugations and 2.0 in (51 mm) for multiplate, is taken as the specific roughness.

Ref: Civil Engineering Reference Manual, 2006

Support Material

accumulation at the upstream row of baffles.

Flow entering the chute should be well distributed laterally across the width of the chute. The velocity should be below critical velocity at the crest of the chute. To insure low velocities at the upstream end of the chute, it may be necessary to provide a short energy dissipating pool. The sequent or conjugate depth in the approach basin should be maintained to prevent jump sweep-out, but the basin length may be considerably less than a conventional hydraulic jump basin since the primary purpose of this pool is only to reduce the average entrance velocity. A basin length of twice the sequent depth will usually provide ample basin length. The end check of the pool may be used as the crest of the chute as shown in Figure HS-17.

## 3.4 Low Tailwater Basins

### 3.4.1 General

The design of low tailwater riprap basins for storm sewer pipe outlets and some culverts is necessary when the receiving channel may have little or no flow and uncontrolled pipe velocities would create erosional problems in the channel. Design criteria are provided in Figures HS-18a through HS-20.

### 3.4.2 Objective

By providing a low tailwater basin at the end of a storm sewer conduit or culvert, the kinetic energy of the discharge is dissipated under controlled conditions without causing scour at the channel bottom. Photograph HS-12 shows a representative low tailwater basin.

### 3.4.3 Low Tailwater Basin Design

For storm sewers, low tailwater is defined as being equal to or less than ⅓ of the storm sewer height, that is:

$$y_t \leq \frac{D}{3} \quad \text{or} \quad y_t \leq \frac{H}{3}$$

in which:

$y_t$ = tailwater depth at design

$D$ = diameter of circular pipe (ft)

$H$ = height of rectangular pipe (ft)

#### 3.4.3.1 Finding Flow Depth and Velocity of Storm Sewer Pipe Outlets

The first step in the design of a scour protection basin at the outlet of a storm sewer is to find the depth and velocity of flow at the outlet. Pipe-full flow can be found using Manning's equation and the pipe-full velocity can be found using the well-known and standard continuity equation. Namely,

$$Q_{full} = \frac{1.49}{n} A_{full} \left(R_{full}\right)^{2/3} S_o^{1/2}$$

in which:

$Q_{full}$ = pipe full discharge at its slope (cfs)

$n$ = Manning's $n$ for the pipe full depth

$A_{full}$ = cross-sectional area of the pipe ($ft^2$)

$S_o$ = longitudinal slope of the pipe (ft/ft)

$R$ = hydraulic radius of the pipe flowing full, ft [$R_{full} = D/4$ for circular pipes, $R_{full} = A_{full}/(2H + 2w)$ for rectangular pipes, where $D$ = diameter of a circular conduit, $H$ = height of a rectangular conduit, and $w$ = width of a rectangular conduit (ft)]

Then,

$$V_{full} = Q_{full} / A_{full}$$

In which:

$V_{full}$ = flow velocity of the pipe flowing full (ft/sec)

The normal depth of flow, $d$, and the velocity at that depth in a conduit can be found with the aid of Figure HS-18b. Using the known design discharge, $Q$, and the calculated pipe-full discharge, $Q_{full}$, enter Figure HS-18b with the value of $Q/Q_{full}$ and find $d/D$ for a circular pipe of $d/H$ for a rectangular pipe.

Compare the value of this $d/D$ (or $d/H$) with that obtained from Figure HS-19 using the Froude parameter, namely,

$$Q/D^{2.5} \quad \text{or} \quad Q/\left(wH^{1/5}\right)$$

Choose the smaller of the two ($d/D$ or $d/H$) ratios to calculate the flow depth at the end of the pipe, namely,

$$d = D(d/D) \quad \text{or} \quad d = H(d/H)$$

Again, enter Figure HS-18b using the smaller $d/D$ (or $d/H$) ratio to find the $A/A_{full}$ ratio. Use this to calculate the area of flow at the end of the pipe, namely,

$$A = \left(A/A_{full}\right)A_{full}$$

in which:

$A$ = area of the design flow in the end of the pipe ($ft^2$)

Finally,

$$V = Q/A$$

in which:

$V$ = design flow velocity at the pipe outlet (ft/sec)

### 3.4.3.2 Riprap Size

For the design velocity, use Figure HS-20 to find the size and type of the riprap to use in the scour protection basin downstream of the pipe outlet (i.e., B18, H, M or L). First, calculate the riprap sizing design parameter, $P_d$, namely,

$$P_d = \left(V^2 + gd\right)^{1/2} \qquad \text{(HS-16)}$$

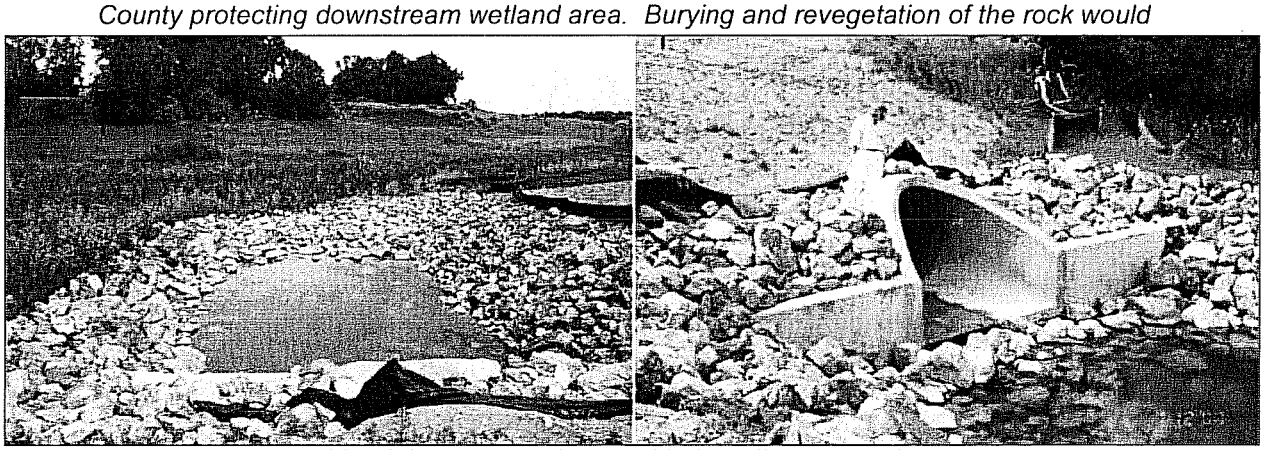
in which:

$V$ = design flow velocity at pipe outlet (ft/sec)

$g$ = acceleration due to gravity = 32.2 ft/$sec^2$

$d$ = design depth of flow at pipe outlet (ft)

*Photograph HS-12—Upstream and downstream views of a low tailwater basin in Douglas County protecting downstream wetland area. Burying and revegetation of the rock would blend the structure better with the adjacent terrain.*



When the riprap sizing design parameter indicates conditions that place the design above the Type H riprap line in Figure HS-20, use B18, or larger, grouted boulders. An alternative to a grouted boulder or loose riprap basin is to use the standard USBR Basin VI, as described in Section 3.2.

After the riprap size has been selected, the minimum thickness of the riprap layer, $T$, in feet, in the basin is set at:

$$T = 1.75 D_{50} \qquad \text{(HS-17)}$$

in which:

$D_{50}$ = the median size of the riprap (see Table HS-9.)

**Table HS-9—Median (i.e., $D_{50}$) Size of District's Riprap**

| Riprap Type | $D_{50}$—Median Rock Size (inches) |
|---|---|
| L | 9 |
| M | 12 |
| H | 18 |
| B18 | 18 (grouted) |

### 3.4.3.3 Basin Length

The minimum length of the basin, $L$, in Figure HS-18a, is defined as being the greater of the following lengths:

for circular pipe,

$$L = 4D \quad \text{or} \quad L = (D)^{1/2}\left(\frac{V}{2}\right) \qquad \text{(HS-18)}$$

for rectangular pipe,

$$L = 4H \quad \text{or} \quad L = (H)^{1/2}\left(\frac{V}{2}\right) \qquad \text{(HS-19)}$$

in which:

$L$ = basin length (Figure HS-18a)

$H$ = height of rectangular conduit

$V$ = design flow velocity at outlet

$D$ = diameter of circular conduit

#### 3.4.3.4 Basin Width

The minimum width, $W$, of the basin downstream of the pipe's flared end section is set as follows:

for circular pipes,

$$W = 4D \qquad \text{(HS-20)}$$

for rectangular pipe,

$$W = w + 4H \qquad \text{(HS-21)}$$

in which:

$W$ = basin width (Figure HS-18a)

$D$ = diameter of circular conduit

$w$ = width of rectangular conduit

#### 3.4.3.5 Other Design Requirements

All slopes in the pre-shaped riprapped basin are 2H to 1V.

Provide pipe joint fasteners and a structural concrete cutoff wall at the end of the flared end section for a circular pipe or a headwall with wingwalls and a paved bottom between the walls, both with a cutoff wall that extends down to a depth of

$$B = \frac{D}{2} + T \quad \text{or} \quad B = \frac{H}{2} + T \qquad \text{(HS-22)}$$

in which:

$B$ = cutoff wall depth

$D$ = diameter of circular conduit

$T$ = Equation HS-17

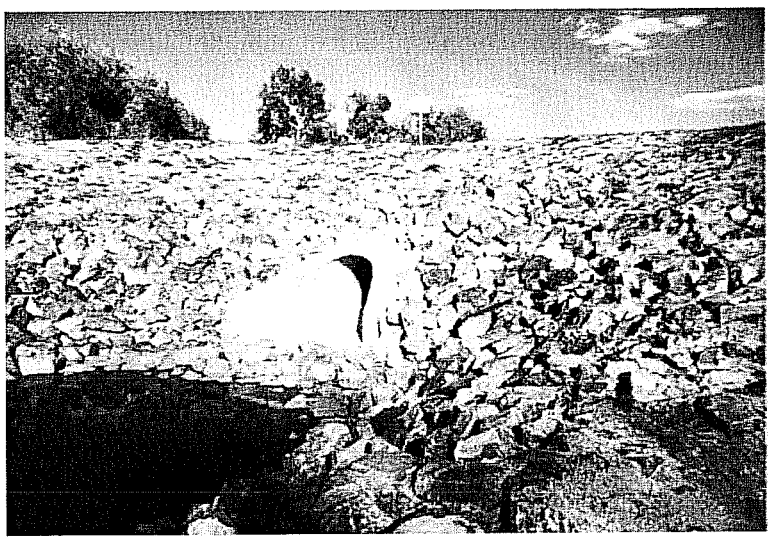
The riprap must be extended up the outlet embankment's slope to the mid-pipe level.

## 3.5 Culvert Outlets

Culvert outlets in the Denver area represent a persistent problem because of concentrated discharges and turbulence that are not fully controlled prior to the flow reaching the standard downstream channel configuration. Too often the designer's efforts are focused on the culvert inlet and the culvert sizing with the outlet hydraulics receiving only passing attention. A culvert design is not complete until adequate attention is paid to the outlet hydraulics and proper stilling of the design flow.

Culvert outlet energy dissipator and flow spreading may require special structures downstream of the culvert outlet to limit local scour, general stream degradation, and troublesome head cutting.

Local scour is typified by a scour hole produced at the culvert outlet. This is the result of high exit velocities, and the effects extend only a limited distance downstream. Coarse material scoured from the circular or elongated hole is deposited immediately downstream, often forming a low bar. Finer material is transported further downstream. The dimensions of the scour hole change due to sedimentation during low flows and the varying erosive effects of storm events. The scour hole is generally deepest during passage of the peak flow. Methods for predicting scour hole dimensions are found in HEC No. 14 (Corry, et al. 1975).



*Photograph HS-13—Culvert outlets are often left unprotected causing downstream degradation. The designer's job is not complete until the outlet hydraulic provisions are made. Burying of riprap and revegetation of the surface would have blended this structure better into the adjacent landscape.*

General storm degradation, or head cutting, can be a phenomenon independent of culvert performance. Natural causes produce a lowering of the streambed over time. The identification of a degrading stream is an essential part of the original site investigation. However, high-energy discharges from a culvert often cause stream degradation that is similar to the former, though limited in distance. Both types of scour can occur simultaneously at a culvert outlet.

As described in HEC No. 14, various measures exist to control culvert outlet flow, as listed below. It is beyond the scope of this *Manual* to provide information about these controls, but the District encourages their proper application and design.

1. Colorado State University rigid boundary basin

2. Tumbling flow rectangular section
3. Increased resistance—box culverts
4. Roughness elements—circular culverts
5. USBR Type II
6. USBR Type III
7. USBR Type IV
8. Contra Costa
9. Hook-type energy dissipator
10. Straight drop structure
11. Riprap basins

In addition, one might consider an extended culvert apron with one or more rows of baffles, or using large rows of offset racks set downstream of the culvert outlet on a bed of suitable riprap without a basin, but with an adequate tailwater depth, all designed in accordance with the criteria given in Section 2.0 of this chapter.

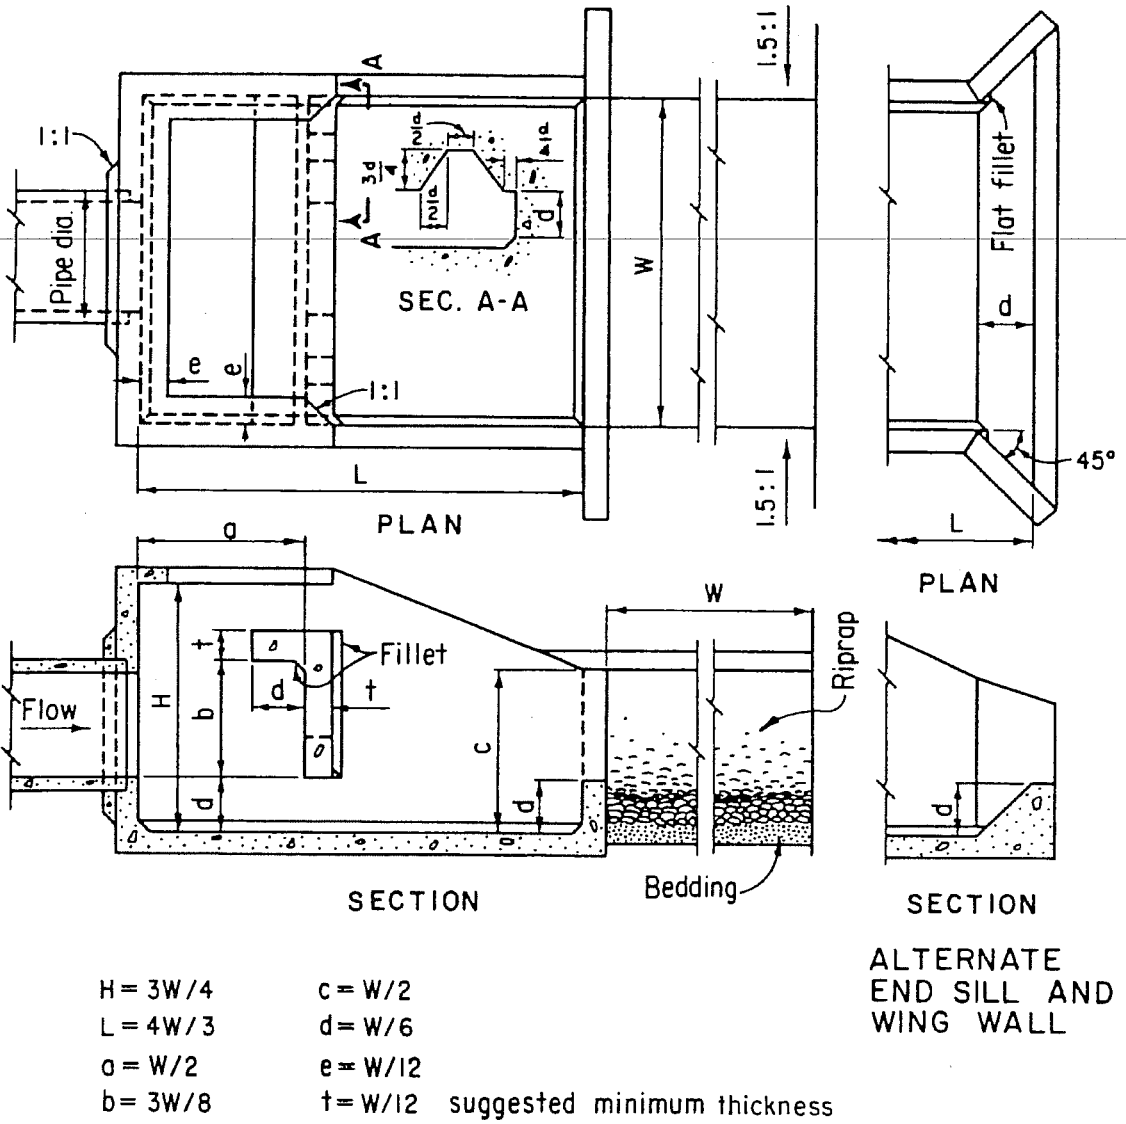


**Figure HS-14—General Design Dimensions Impact Stilling Basin (USBR VI)**

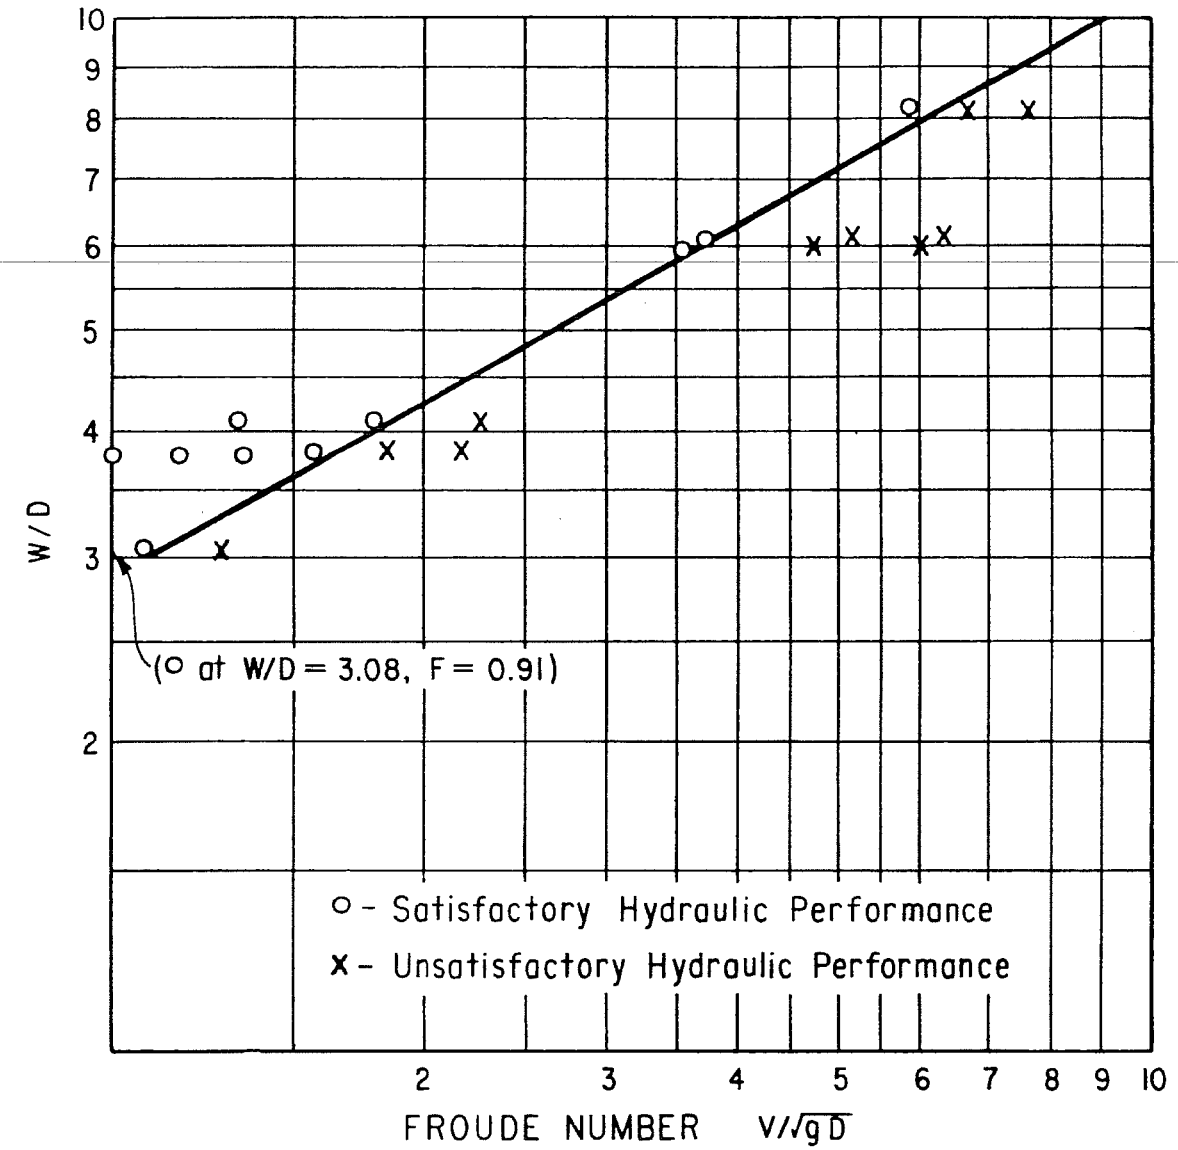

"W" is the inside width of the basin.
"D" represents the depth of flow entering the basin and is the square root of the flow area at the conduit outlet.
"V" is the velocity of the incoming flow.
The tailwater depth is uncontrolled.

# Analysis Report

August 20, 2010

Carbon Resources LLC
PO Box 11789
Albuquerque, NM 87192
USA

**Client Sample ID:** CR-06-01 1/7 Floor
**Date Received:** 08/06/2010
**Matrix:** Unknown

**Kind of Sample :** Overburden

Rock

**SGS Minerals Sample ID: 072-47377-001**

| Tests | Result | Unit |
|---|---|---|
| Specific Gravity | 2.67 | |
| pH | 6.10 | s.u. |
| pH Temperature | 19.20 | °C |
| Acid Potential | 19.1 | |
| Neutralization Potential | 4.0 | |
| Conductivity | 2500 | umhos/cm |
| Carbon, Total Organic | 0.54 | % |
| Calcium Carbonate | <0.10 | % |
| Selenium, Hot Water | 0.07 | ppm |
| Calcium, Soluble | 490 | ppm |
| Magnesium, Soluble | 100 | ppm |
| Potassium, Soluble | 130 | ppm |
| Sodium, Soluble | 59 | ppm |
| Sodium Absorption Ratio | 3.4 | |
| Boron Available | 1 | ppm |

Sample Notes:
Neutralization Potential and Acid Potential reported as tons CaCO3 / 1000 tons material.

Mr. Brad Lindsay
Rock Logic Consulting, LLC
P. O. Box 544
Cedaredge, CO 81413

RE: **Carbon Resources, LLC—Rock Mechanics Core Testing Results**

Dear Mr. Lindsay:

This letter provides a summary of the recent rock mechanics core testing performed by Agapito Associates, Inc. (AAI), on behalf of Rock Logic Consulting, LLC (Rock Logic). Rock Logic provided 3.2-inch-diameter core samples with lithologic descriptions for laboratory testing. The samples were selected by Rock Logic, and the cores were from holes numbered CR-06-01 and CR-06-02.

Uniaxial compressive strength tests were performed by AAI at ambient temperature according to the American Society for Testing and Materials (ASTM) specifications:

- Uniaxial compressive strength (UCS) test with and without elastic properties: D2938-95[1]/D3148-93[2]

Test results are summarized in Table 1.

The attached CD contains an electronic version of the Microsoft Excel test sheets, as well as UCS-with-elastic properties laboratory data sheets in Adobe Portable Document Format (PDF). Also attached is a chain of custody.

[1]American Society for Testing and Materials (ASTM), "Standard Test Method for Unconfined Compressive Strength of Intact Rock Core Specimens," Designation D2938-95 (Re-approved in 1992).

[2]American Society for Testing and Materials (ASTM), "Standard Test Method for Elastic Moduli of Intact Rock Core Specimens in Uniaxial Compression," Designation D3148-93.

Please contact me if you have any questions.

Sincerely,

Albert Adu-Acheampong
Project Engineer

AAA/smvf

Attachments (3): Table 1
Chain of Custody
CD containing complete testing data

**Instructions**

1- Do not allow the samples to dry more than needed to perform the analyses.
2- Some samples will be chemically analyzed following these tests. Thus, it is imperative that the samples are not contaminated by other samples or other materials. Please ensure that the testing apparatus and the area that will contain the debris from testing are clean.
3- It is imperative that none of the sample is lost during testing. After analysis is complete, gather the remaining sample and sample debris and place the material in a durable sealed heavy plastic bag or container for storage. Retain the sample until picked up by Rock Logic.
4- Place the drill hole number, sample ID, and sample depth interval on the analysis sheet.
5- Be sure to use the correct confining liquid for triaxial tests stated in the analyses requested.
6- Contact Brad Lindsay when the samples are ready for pick-up.

RE: **Carbon Resources, LLC—September 2006 Rock Mechanics Core Testing Results**

Dear Mr. Lindsay:

This letter provides a summary of the recent rock mechanics core testing performed by Agapito Associates, Inc. (AAI), on behalf of Rock Logic Consulting, LLC (RLC). RLC provided 3.0-inch-diameter core samples with lithologic descriptions for laboratory testing. The samples were selected by RLC, and the cores were from holes numbered CR-06-10, CR-06-09-BLW, CR-06-05, and CR-06-05-A.

Uniaxial compressive strength (UCS) tests were performed by AAI at ambient temperature according to the American Society for Testing and Materials (ASTM) specifications:

- Uniaxial compressive strength test with and without elastic properties: D2938-95[1]/ D3148-93[2]

Test results are summarized in Table 1. Per Mr. Lindsay's request, samples with length-to-diameter ratio less than 2 were tested.

The attached CD contains an electronic version of the Microsoft Excel test sheets, as well as UCS-with-elastic properties laboratory data sheets in Adobe Portable Document Format (PDF). Also attached is a chain of custody.

[1]American Society for Testing and Materials (ASTM), "Standard Test Method for Unconfined Compressive Strength of Intact Rock Core Specimens," Designation D2938-95 (Re-approved in 1992).
[2]American Society for Testing and Materials (ASTM), "Standard Test Method for Elastic Moduli of Intact Rock Core Specimens in Uniaxial Compression," Designation D3148-93.

Please contact me if you have any questions.

Sincerely,

Albert Adu-Acheampong
Project Engineer

AAA/smvf

# Exhibit 20

# Ephemeral Drainage Determination

# EPHEMERAL DRAINIAGE DETERMINATION

(Updated May 2011)

The USGS 7.5 minute Scofield Quadrangle Map depicts perennial, and intermittent, streams with a dark blue drainage line while ephemeral drainages are shown with a light blue dashed-line, or simply as a topographic v-notch without a drainage marking line altogether. There are five short, straight, E-W drainages within and or immediately north of the permit boundary shown on the Scofield USGS 7.5 Minute Quad as ephemeral drainages because they are represented by a v-notch in the topo contours only and lack any kind of drainage marking line. For purposes of this work, those five drainages have been named, from North to South, Monay Draw, Blue Seal Draw, Kinney Draw, Columbine Draw, and Jones Draw, and are marked with a dash-dot light blue line marking the likely course of each drainage, View 1, (Ephemeral Drainages, Drainage Divides, and Piezometric Surface). A light blue ephemeral drainage dashed line has been added to the map for consistency in designation. Two additional drainages, Eagles Canyon and UP Canyon, are both shown as ephemeral drainages on the USGS 7.5 minute Scofield Quadrangle with the light blue dashed line. Mud Creek and the lower reach of Miller Creek are the only Perennial Streams near the Permit Boundary and are shown with a dark blue solid line on the Scofield Quadrangle. Baseline data have been collected from these two Perennial Streams, View 2(Ephemeral Drainage Determination).

The seven ephemeral drainages described above together with the groundwater table are the subjects of this discussion due to concern that baseline data were not collected from them those seven drainages. The argument is “absent baseline water samples from the seven drainages how can we be certain they are ephemeral?”

Baseline data were collected on the ephemeral drainages beginning with Photographs taken of the four drainages that are actually located within the Permit Boundary (Eagles Canyon, Kinney Draw, Columbine Draw, and Jones Draw) during the baseline monitoring period that demonstrate the absence of water (Appendix 1, Drainage Photos). Not only do these photographs document the absence of water, when they were taken, but also document the lack of alluvium and the lack of vegetative differences across the drainage bottom. Additional baseline data were collected during 21 field visits documented below.

The documented lack of running water alone, at any point in the year, disqualifies all four of these drainages from being classified as Perennial; a stream that flows year round. Therefore the only question is, are these four drainages ephemeral or intermittent? The same question is directed to the other three E-W drainages, Monay Draw and Blue Seal Draw, and Up Canyon. Photo aspects are shown on View 3, Appendix 1.

## DEFINITIONS

A search of the literature on the internet was conducted to establish a working definition of ephemeral and intermittent streams. There appears to be a legal definition held by most government agencies, including UDOGM, and then a more robust but not settled academic definition(s). Below are a few of the many definitions of ephemeral and intermittent streams (drainages) and below them is a summary of the salient aspects of all the definitions.

## Ephemeral Stream Definitions:

OXFORD UNIVERSITY PRESS Ephemeral stream

A Dictionary of Earth Sciences; AILSA ALLABY and MICHAEL ALLABY; 22 words... **ephemeral stream** A stream which flows only after rain or snow-melt and has no **baseflow component**. A desert wadi may form an **ephemeral stream**.

DETROIT DISTRICT
United States Army Corps of Engineers REGULATORY OFFICE

# GLOSSARY OF TERMS

**The following glossary of terms where taken verbatim from the *Federal Register, Vol.65, No.47,* dated March 9, 2000, pages 12897 - 12899.**

EPHEMERAL STREAM: An ephemeral stream has flowing water only during, and for a short duration after, precipitation events in a typical year. Ephemeral stream beds are located above the water table year-round. Groundwater is not a source of water for the stream. Run-off from rainfall is the primary source of water for stream flow.

INTERMITTENT STREAM: An intermittent stream has flowing water during certain times of the year, when groundwater provides water for stream flow. During dry periods, intermittent streams may not have flowing water. Runoff from rainfall is a supplemental source of water for stream flow.

The South Carolina General Assembly 116th Session, 2005-2006 officially adopted the Corps of Engineers Definition of Ephemeral Stream for use in wetlands cases. (See Reference)

# Types of Water Resources Common to Forestry

It is important to understand what kind of stream or other surface water is on-site whenever forestry activities are planned or conducted. Applying the wrong stream classification may result in compliance issues related to FPGs, stream/ditch obstruction laws and/or DWQ Riparian Buffer Rules.

**Protection of Streams and Waterbodies**
Intermittent and perennial waterbodies, such as ponds or lakes, must be treated with the same protection as streams when complying with the FPGs and DWQ Riparian Buffer Rules. In the FPGs, a "waterbody" is a natural or man-made basin that stores water, but does not include jurisdictional wetlands or beaver ponds.

**Stream Classifications for FPG Compliance**
The FPGs define a stream as "a body of concentrated flowing water in a natural low area of the land surface" (15A NCAC .01I .0101-.0209). The FPGs further define three types of streams as follows.

**Ephemeral Stream**
An ephemeral stream is defined as "a stream that flows only during and for short periods following precipitation and flows in low areas that may or may not have a well-defined channel." Some common names for ephemeral streams include: drain, swale, gully, slough (pronounced 'slew') or hollow. Ephemeral streams do not require a SMZ. However, it is strongly encouraged that skid trails, roads, site-prep and other soil-disturbing activities be minimized in the ephemeral streams to avoid erosion and sedimentation of runoff that can flow from the ephemeral into other streams or waterbodies.

**Intermittent Stream**
An intermittent stream is defined as "a stream that flows only during wet periods of the year (30% - 90% of the time) and flows in a continuous well-defined channel." During dry periods, especially in spring and summer months, intermittent streams may appear as only a trickle of water or may seem to be totally dry, when in fact there is water retained within the stream bottom or "stream substrate". This water retention below the soil surface is usually caused by seasonal changes of the local water table.

American Geophysical Union, Fall Meeting 2006, abstract #H13A-1368

“In order to classify recharge potential (RCP) in ephemeral-stream channels, a method was developed that incorporates information about channel geometry, vegetation characteristics, and bed-sediment apparent electrical conductivity ('a)….”

This work includes channel geometry, vegetation and bed-sediment apparent conductivity in the definition. Some of the concepts apply to the Scofield Drainages.

## Glossary of Water Terms

**EPHEMERAL STREAM**

A stream or reach of a stream that flows briefly only in direct response to precipitation in the immediate locality and whose channel is at all times higher than the water table.

**INTERMITTENT STREAM**

A stream that ceases to flow occasionally or seasonally because evaporation and leakage to ground water exceed the available water supply.

A rather exhaustive list of ephemeral stream references can be found in Appendix(__)

## Intermittent Stream Definitions:

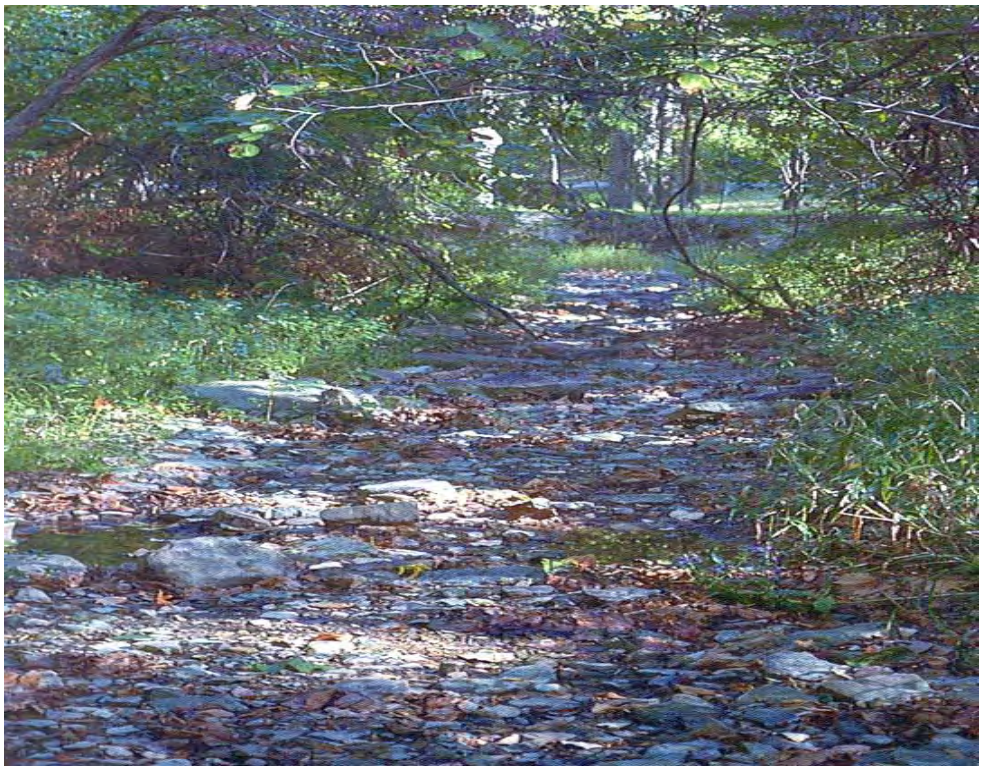
First Edition Preface Second Edition Preface Acknowledgments

**Intermittent stream**—A stream that carries water a considerable portion of the time, but that ceases to flow occasionally or seasonally because bed seepage and evapotranspiration exceed the available water supply.
*Compare* ephemeral stream, perennial stream.

**INTERMITTENT STREAM**

*R4SBF, R4SBC



In this wetland type, the channel contains flowing water for only a portion of the year. When not flowing, the water may remain in isolated pools, or surface water may be absent.

The substrate consists of organic deposits, sand, gravel, cobble, rubble, bedrock, or pioneering plants. There are generally no named soils in this community, although some areas may be listed as mixed alluvial land.

Vegetation is dependent on the length of inundation, as well as the substrate type. In many cases, streambeds are not vegetated because of the scouring effect of the moving water, but occasionally" pioneering" annuals or perennials may colonize the area during low flow. Many small drainage ditches are included with this type.

*dnr.state.il.us/Wetlands/**intermittent**.htm - 3k*

*Used throughout the community descriptions to indicate the most commonly occurring code in Illinois

**Intermittent Stream Definition:**

A stream that goes dry at certain times of the year. Intermittent streams flow during seasons of the year when runoff and/or ground water contributions sustain the flow of the stream. They stop flowing during dry seasons when precipitation is low and the water table drops below the bed of the stream.

UDOGM's own revised definition of Intermittent Stream.

**Utah Division of Oil, Gas & Mining**
**Informal Rulemaking Process**
**UMA Topic #5: Intermittent Stream**
**Proposed Coal Draft Rule from UMA, DOGM Received 11/7/07**
**Including DOGM Nonsubstantive Edits 11/21/07**

**Proposed Rule Change in part of R645-100-200.:**

"Intermittent Stream" means ~~(a) a stream, or reach of a stream, that drains a watershed of at least one square mile, or (b)~~ a stream, or reach of a stream, that is below the local water table for at least some part of the year and obtains its flow from both surface runoff and groundwater discharge.

**Legal "consensus definitions" for stream classifications are:**

Ephemeral Streams flow water only in response to precipitation and the water table is always below the stream base. Intermittent Streams flow water much of the year and the water table is above the base of the stream much of the year contributing to their flow. This definition includes the revised UDOGM definitions (above).

**Characterization of Drainages**

Using the criteria in the Legal Consensus definition alone it is easy to demonstrate that the seven drainages within and adjacent to the permit boundary are clearly ephemeral. First, however, a discussion of the local water table is required.

Baseline static water level data from monitor wells CR-10-11, CR-10-12, CR-06-03, and CR-06-09 were integrated with elevation intercepts from the perennial Mud Creek and the perennial lower reach of Miller Canyon/Long Canyon, and Scofield Reservoir to construct a peizometric surface model using SURV-CAD and is presented on View 1. These data provide consist support for the presence of a regional, or semi-regional, water table (piezometric surface) beneath the permit area (Maps 7A and 7B, X-Section A-A' and C-C', Chapter 7, Hydrology).

Topographic contours shown in gray with semi-regional water table (piezometric surface) contours shown in light blue, beneath the topography, clearly demonstrate that

all of the seven drainages shown as ephemeral (Eagles Canyon, Monay Draw, Blue Seal Draw, Kinney Draw, Columbine Draw, Jones Draw, UP Canyon) are above the water table throughout their entire length. Bold letters “A” through “G” on View 2 post the differences in elevation between the bottom of each drainage and the peizometric surface (depth to the water table) at the westernmost location within each respective drainage basin where the elevation difference is the smallest. That is, the difference between the bottom of each drainage and the peizometric surface is smallest down-gradient, closer to base level represented by Scofield Reservoir and increases significantly eastward or upstream on each drainage.

Constraints on the elevation and gradient of the water table also explain the observed intermittent nature of the Long Canyon portion (upper reach) of the Miller Canyon Stream.

Geometric properties (area, length, elevation and average slope) of the seven ephemeral drainages together with those of the two perennial streams are summarized below in TABLE 1.

**TABLE 1**

**Drainages Arranged North to South**

| Kinney Drainage Basin Areas | | | Kinney Drainage Average Gradient (Slope) | | | | |
|---|---|---|---|---|---|---|---|
| Drainage | SQ FT. | Acres | Top Elev | Base Elev | Elev Drop | Length | Avg Slope |
| Miller Canyon | 224,900,115.77 | 5,163.00 | 9,100.0 | 7,660.0 | 1,440.0 | 33,275.8 | 4.3% |
| Eagles Canyon | 28,232,397.56 | 648.13 | 8,600.0 | 7,660.0 | 940.0 | 10,182.1 | 9.2% |
| Monay Draw | 2,714,510.69 | 62.32 | 7,980.0 | 7,800.0 | 180.0 | 760.0 | 23.7% |
| Blue Seal Draw | 1,789,775.88 | 41.09 | 7,980.0 | 7,820.0 | 160.0 | 641.0 | 25.0% |
| Kinney Draw | 2,578,528.62 | 59.19 | 7,980.0 | 7,760.0 | 220.0 | 875.4 | 25.1% |
| Columbine Draw | 2,049,214.37 | 47.04 | 7,880.0 | 7,800.0 | 80.0 | 248.0 | 32.3% |
| Jones Draw | 5,041,158.90 | 115.73 | 8,080.0 | 7,820.0 | 260.0 | 1,202.1 | 21.6% |
| UP Canyon | 36,746,615.67 | 843.59 | 8,500.0 | 7,800.0 | 700.0 | 6,279.0 | 11.1% |

Groundwater Monitoring Data for Monitor Wells CR-06-01-BLW, CR-06-02, CR-06-05A, CR-10-11, and CR-10-12 are shown on Exhibit 10 (Surface and Ground Water Field Measurements) and graphically depicted on Maps 7, 7A,7B. Data in Exhibit 10 document, for a duration of four years (2006-20010), the upper limit of the static water level beneath Monay Draw, Blue Seal Draw, Kinney Draw, Columbine Draw, Jones Draw, UP Canyon, as positioned a minimum of fifty two (52) feet below the lowest point in the bottom of the lowest of these drainages.CR-06-01-BLW is actually located in Jones Draw providing absolute site specific data. The groundwater surface (piezometric) clearly is lower near the Scofield Reservoir where the lowest portions of the drainages terminate.

In addition to the four year data set documenting the position of the groundwater table in the local area, the following twenty two (21) visits to Scofield by Ben Grimes, over the course of roughly the same four years (5-26-06 through 10-20-10), where he was surveying in the area and can testify it was not raining and observed no water running in any of the eight drainages listed above, except Miller Canyon which is perennial, as he passed by them: (5-26-06,10-16-06,10-27-06,5-8-07,9-20-07,9-21-07,10-27-07,9-22-09,9-23-09,9-28-09,9-29-09,9-30-09,10-1-09,4-26-10,4-27-10,7-3-10,8-19-10,9-7-10,9-14-10,9-16-10,9-30-09,10-20-10).

**The data presented above clearly demonstrate several things:**

1. There **is** a semi-regional peizometric surface in the permit area.
    a. Evidence for this surface includes the consistency of data which is taken to be the elevation of the two perennial streams (Mud Creek, & Miller Creek/Long Canyon), along their apparent effluent reaches, and the intercepts of the five monitor wells.
    b. Even though the faults are not shown on the maps Views 1 & 2), the existing data suggest that the faults **do not significantly partition the water flow along the peizometric surface in the saturated zone**. The peizometric surface shown on the maps above is very smooth due to the paucity of data, however, it is fully expected that the surface has some ridges and valleys, very likely caused by the local down-gradient retarding or damming effect (instead of the partitioning effect) of the larger faults. This is likely represented by the apparent anomaly of Monitor Well CR-06-05A that has never shown a static water level.
2. The local recharge area is obviously Jump Creek, Long Canyon and to a lesser extent Eagles Canyon.
3. The seven drainages (Eagles Canyon, Monay Draw, Blue Seal Draw, Kinney Draw, Columbine Draw, Jones Draw, Up Canyon) adjacent to or passing over the permit area are;
    a. a single straight reach (lacking meanders, low sinuosity) except for Eagles and UP Canyons, whose courses are controlled by faulting.
    b. steeply inclined to the west (also note elevations in Table 1)
    c. small catchment (drainage basin) areas
        i. average rainfall collected over the small catchment areas does not, on its own, support perennial flow Table 2.
    d. above the water table (peizometric surface) along their entire length (View 2).

**TABLE 2**

| **Water Calculations** | **Basin** | **Annual Precipitation** | | **Annual Flow** | | |
|---|---|---|---|---|---|---|
| Drainage | Acres | Inches | Gallons | AVG gpm | Gallons | as % of Annual Precipitation |
| Miller Canyon | 5,163.0 | 17.2 | 2,414,200,360 | 175.0 | 99,713,250 | 4.13028% |
| Eagles Canyon | 648.1 | 17.2 | 303,061,935 | 22.0 | 12,535,380 | 4.13624% |
| Monay Draw | 62.3 | 17.2 | 29,139,037 | 2.1 | 1,196,559 | 4.10638% |
| Blue Seal Draw | 41.1 | 17.2 | 19,212,429 | 1.4 | 797,706 | 4.15203% |
| Kinney Draw | 59.2 | 17.2 | 27,679,331 | 2.0 | 1,139,580 | 4.11708% |
| Columbine Draw | 47.0 | 17.2 | 21,997,383 | 1.6 | 911,664 | 4.14442% |
| Jones Draw | 115.7 | 17.2 | 54,114,546 | 3.9 | 2,222,181 | 4.10644% |
| UP Canyon | 843.6 | 17.2 | 394,458,191 | 28.5 | 16,239,015 | 4.11679% |
| | | | | Hypothetical Flow | | |

Miller Canyon is the only perennial stream on Table 2 and is used as an example of average flow as a percentage of annual precipitation. That is, Miller Canyon averages 175 gpm annually which is approximately 4.1 percent of precipitation in its catchment basin. The similarities in geology, vegetative ground cover, and elevations are expected to yield a roughly similar ratio of flow as a percentage of precipitation. Hypothetical flows that would result in the approximate same ratio were inserted into the calculations and are shown to be extremely low.

Data presented above, taken in its entirety, make it impossible to characterize the seven subject drainages as perennial or as intermittent. **The inescapable conclusion is that these seven drainages are ephemeral.**

**In addition to the legal definition of ephemeral and intermittent streams cited above, the quoted definitions also include more in-depth academic definitions summarized below that provide additional parameters by which to judge the seven subject drainages.**

**Ephemeral Stream (Drainage):**

- Flow water only after rain fall or snow melt. (In direct response to precipitation)
    - Carries water less then 30% of year
- Above water table year round
    - Ground water is not a source of water for the stream
- No base-flow component
    - No or minimal bank and bed-storage capacity
    - Minimal or no springs in drainage basin
        - Perched aquifer springs only
- May not have a well defined channel
- Very Low Sinuosity
- May or man not have water flow generated alluvium in stream bed
- A high roughness coefficient (Manning's Equation)
    - Suggests steeper vertical profiles
- Relatively low bed sediment conductivity
- Very-low to low aquatic taxa

**Intermittent Stream (Drainage):**

- Carries water a considerable portion of the time
    - Flows water 30 to 90% of year
    - Ceases to flow occasionally or seasonally because bed seepage and evapotranspiration exceed available water supply
- Below water table for at least some part of the year
    - Obtains flow from both surface runoff and groundwater
    - Has a base flow component
        - Typically has bank and bed-storage capacity
- May have springs in drainage basin
- Has a well defined channel
- Has flow generated alluvium in stream bed

- Low Sinuosity
- A lower roughness coefficient than ephemeral (Manning's Equation)
    - Generally less steep vertical profiles than ephemeral
- Relatively low bed sediment conductivity
- Moderate to high aquatic taxa

**These "academic definitions" might not be exhaustive but are useful anyway. Major common threads between the definitions are:**

1. Use of a water table to differentiate between ephemeral and intermittent streams. As with the Legal Definition.
2. The presence of **bank and or bed storage capacity** as a part of the "base flow component" as defining intermittent streams but are lacking in ephemeral Streams.
    a. Bank and bed storage requires, among other things, presence of alluvium**,** highly fractured bedrock, or abandoned meanders or abandoned channel segments leaving permeable stream level terraces.

The general correlation between higher sinuosity and a higher likelihood of bank and bed storage capacity forwards the idea that streams with higher sinuosity are more likely to have a component of "base flow" issuing from bank and bed storage and are therefore not likely to be ephemeral.

The discussion of bank and bed storage also has relevance to the discussion of vados zone springs addressed in Chapter 6, Geological Information.

3. **Intermittent streams always have alluvium**; ephemeral streams may or may not have alluvium.
4. **Ephemeral streams tend to have steeper gradients than do intermittent streams** as expressed as a component of the Manning Equations roughness coefficient. Ephemeral streams have a higher roughness coefficient than intermittent streams. This is also reflected in sinuosity; steeper gradient streams display less sinuosity than lower gradient streams.
5. **Intermittent streams always have a well defined channel. Ephemeral streams may or may not have a well defined channel.**

**Applying the "academic definition common threads" to the four streams that pass through the permit boundary provides further weight to the argument that they are in fact ephemeral.**

The commonalities of the four drainages that support an ephemeral classification are:

- Small Drainage Basin
- Elevated and steeply inclined
- Low sinuosity
- Absent or poorly defined channel
- Virtual absence of alluvium in the channel
- No noticeable difference in vegetation between channel and drainage basin

- Virtual absence of bank and bed storage material. Together these features describe drainages that are small, steeply inclined basins, high and dry above the regional water table, completely lacking the ability to catch and retain sufficient water to create sufficient bank or bed storage to support a flow that persists for more than hours following a rain storm or for days after the snow pack has melted. **This describes ephemeral streams**.

The key legal issue that disqualifies all seven of the streams described above from being classified as intermittent streams is the absence of flow from the water table for any portion of the year. A stream that is physically located tens to hundreds of feet above the well documented local water table cannot receive any water from the ground water table and therefore cannot be classified as an intermittent stream.

There is no question that the seven drainages in an adjacent to the permit area (Eagles Canyon, Monay Draw, Blue Seal Draw, Kinney Draw, Columbine Draw, Jones Draw, and UP Canyon) **are in fact Ephemeral.**

RE: Kinney #2 Mine, C/007/0047, Carbon County, Utah

In Reply Please Refer to Case No. 05-1843

Dear Mr. Haddock:

The Utah State Historic Preservation Office received your request for our comment on the above-referenced project on September 30, 2010.

USHPO recommends a determination of No Adverse Effect for the undertaking.

This letter serves as our comment on the determinations you have made, within the consultation process specified in §36CFR800.4. If you have questions, please contact me at 801-533-3555 or Lhunsaker@utah.gov or contact Jim Dykmann at 801-533-3523 or Jdykman@utah.gov

Sincerely,

Lori Hunsaker

Subject: Decision on No Adverse Effect to Historic Properties, Carbon Resources, Kinney #2 Mine, C/007/0047, Carbon County, Utah, Outgoing File

Dear Ms. Hunsaker:

After the telephone conference held on September 14, 2010, the Division has revised it's determination of Archeological clearance for the above-referenced mine. Please find enclosed a letter and map from Montgomery Archaeological Consultants, (MOAC), prepared by Jody Patterson.

The letter and map provide additional information and clarification about the three eligible sites, (42cb477, 42cb479 and 42cb1032), at the proposed Kinney #2 mine location. Previously a file search was conducted on May 15, 2007 and a class three pedestrian survey identifying these eligible sites was conducted by MOAC between May 16 and 25, 2007.

According to the additional information, **Site 42cb477** will be avoided although fencing is recommended. **Site 42cb479**, the original Kinney mine opened in 1920, contains 12 features. All but one of these features will be avoided. Only feature 12, thought to be a tipple area, may be potentially affected by the footprint of the disturbed area. The feature is 7 to 10 feet away from the disturbance area and only 4% of the site may be encroached upon by the proposed mine. **Site 42cb1032** is a minor spur of the Utah and Pleasant Valley Railway. In as much as the adjoining rail system has been continually upgraded and maintained into the 1970's, two minor impacts to the spur would not have an adverse impact on the railroad grade.

MOAC has recommended a "no historic properties adversely affected" determination for the three sites as discussed in the additional information and site map provided.

The Division agrees with MOAC's recommendation and makes a determination of no adverse effect to historic properties. We seek your concurrence with this determination. Please provide your concurrence at your earliest convenience.

Thank you for your comments on this case. Should you have any further questions, please contact me at (801) 538-5325 or Joe Helfrich at (801) 538-5290.

Sincerely,

Daron R. Haddock
Permit Supervisor

20 September 2010

Dear Mr. Hunt,

As per your request, I have reviewed the site and GIS data to determine potential impacts to sites 42Cb447, 42Cb449, and 42Cb1032 and whether any impacts could be considered as an adverse effect on these sites.

Site 42Cb447 is the old Jones Mine located on the southern end of the Kinney 2 Mine. Originally the site had five features, four of which were destroyed during mine reclamation. All five features, including a hopper, a tipple, a wood frame building, a fan house, and the mine portal, were documented prior to reclamation. The HABS/HAER documentation for the Jones Mine can be found online at http://memory.loc.gov/cgi-bin/query/D?hh:1:./temp/~ammem_jaB5::. The one remaining standing structure, a fan house, is located 40-45 feet south of the nearest disturbance area. Although the feature is avoided, you may want to consider placing environmental fencing at the edge of the proposed disturbance as a safety and avoidance measure. Since the site has been well documented and reclaimed and the only remaining structure is avoided by the undertaking, MOAC recommends a "no historic properties adversely affected" determination for site 42Cb477 pursuant to Section 106, CFR 800.

Site 42Cb479 is the original Kinney Mine opened in 1920. The site consists of 12 features including eight retaining walls, two concrete foundations, and one standing structure, believed to be a powder house. All but one of these features are avoided by the proposed disturbance footprint for the undertaking. The powder house is approximately 50 feet east of the disturbance area. The retaining walls are avoided by a minium of 45 feet and some by as much as 122 feet. One of the two concrete foundations, thought to represent the remains of a truck scale, is over 100 feet from the nearest disturbance. Only Feature 12, which may be related to the mine's tipple, could be potentially impacted by the undertaking. The feature is only 7 to 10 feet away from the disturbance area. The proposed mine footprint encroaches on approximately 4% of the surface area of 42Cb479. Given the minor amount of disturbance to the existing features at the site and the limited amount of new surface disturbance within the site boundary, MOAC recommends a "no historic properties adversely affected" determination for site 42Cb479 pursuant to Section 106, CFR 800.

MONTGOMERY
ARCHAEOLOGICAL
CONSULTANTS
Box 219, 322 East 100 South, Moab, Utah 84532 (435) 259-5764 Fax (435) 259-5608

Site 42Cb1032 is a minor spur of the Utah and Pleasant Valley Railway that served the Jones, Kinney, and Columbine Mines, as well as several prospects in U P canyon. The spur left the main line a mile north of Scofield and paralleled the east edge of the valley, passing east of the the Scofield Cemetery and ending in U P canyon. As recorded by MOAC in 2007, the spur has been abandoned since the 1970s. Although some portions still retain ties and rail, most of the segment consists of just the railroad bed. Two small portions of the spur will be impacted by the new mine. Given that the site is a minor spur on a large rail system, has been continually upgraded and maintained into the 1970s, the minor impacts to the railroad grade will not have an adverse effect on the site. A "no historic properties adversely affected" determination is recommended for this segment of 42Cb1032.

Overall, the impacts of the proposed undertaking on eligible cultural resource are negligible and a determination of "no historic properties adversely affected" is recommend for this undertaking.

Based on the telephone conference last week, Ms. Hunsaker is willing to re-examine the determination of effect for this project, but DOGM would have to resubmit a consultation letter. However, it is unclear what DOGM needs from us to be able to do this. I hope this letter may serve as an addendum to our initial recommendations made in the U-07-MQ-0612 report. One item Ms Hunsaker did ask for was a map showing the disturbance area of the mine in relationship to the sites and features. I have attached this map to this letter.

If you or DOGM need additional information or documentation concerning our recommendations, please feel free to contact me at your convenience.

Sincerely,

Jody J. Patterson
