Inspection Memo
to Coal File:

RE: Geneva Mine
U. S. Steel Corporation
ACT/007/013, Folder # 7
Carbon County, Utah

An inspection of the Geneva Mine site was conducted by Sandy Pruitt and Paul Clark on January 19, 1984. Due to deep snow cover, the entire mine area could not be inspected at this time. The road had been cleared as far east as the rock duster for removal and dismantling. The road to the PCB storage shed was also clear. A Rawlins Enviromental truck was on-site at the time of this inspection to pick up a load of PCB contaminated material and transformers to haul to Deer Park, Texas, for permanent disposal. Most of the materials in the PCB storage shed had been removed. There is still about one more load though (five drums and a large transformer in the shed, a transformer in the tipple and at the south fan will also be removed). The road to the scales by the tipple had also been cleared and this area was inspected. The sewage treatment plant has been shut down so there will be no discharge from NPDES point 003. The boiler is down and all fans have been shut down. The mine portals had not been sealed yet due to the weather. Water is no longer being pumped from the mines so there is no discharge monitored from the NPDES points 001 and 002.

U. S. Steel's East Carbon Office will move to Somerset the week of February 13, 1984. Paul Clark will still be available at the Geneva Mine. U. S. Steel should still insure that all mine permits are available for public inspection as required.

U. S. Steel intends to commence reclamation of the Geneva Mine this summer. They will begin portal sealing, dismantling structures on the facilities and removing all scrap material as soon as weather permits. As reclamation must comply with the permanent program performance standards, DOGM is currently reviewing the reclamation portion of the mining and reclamation plan submitted in March 1981 for approval and implementation this summer.

Sandy Pruitt
Field Specialist
