Report summary and status for pending enforcement actions, permit conditions, Division Orders, and amendments:

Access to the mine site was blocked by logs and logging equipment. I walked to the reclaimed mine site. The upper portion of the road is snow packed. The site is snow covered. Melting snow is flowing along terraces, except in one location where it flows across the slope in a gully at a rate estimated to be 20 gpm. See photos taken and saved to the 05262011 folder.

4.c Hydrologic Balance: Other Sediment Control Measures

Whiskey Creek is overflowing its banks at the confluence with Eccles Creek. Both streams are sediment laden.

9. Protection of Fish, Wildlife and Related Environmental Issues

Young grass shoots were seen growing on the terrace berms and slopes. Grasses had germinated directly through biosolids. See photos.

10. Slides and Other Damage

Fill placed in the large subsidence hole last fall has collapsed into the hole approximately 2 ft.

12. Backfilling And Grading

Snow covers the terraces and slopes. Melting snow is flowing along terraces. There is one gully that has been created from flow cascading down the cut slope at the north end of the site. The flow continues down across the slope at the location of the beginning of R1 all the way to the reconstructed portion of the Whiskey Creek channel. The flow was estimated at 20 gpm.

16.b Roads: Drainage Controls

All culverts were flowing (about 20 gpm) along the paved access road to the mine site.
