DRILL PLAN

Waste Rock Disposal Site Water Monitoring Well

This proposed water monitoring well will be located in the SW1/4, NW1/4, Sec 4, T13S, R7E SLBM, and is shown on the attached map. The purpose of the water monitoring well is to provide a sampling source to determine the effects, if any, of leachate from the Scofield disposal site on ground waters.

The well will be a 4" cased hole with a planned depth of 50' - 100'. The casing will be capped with a locked cap, and the outside of the casing grouted, if needed, to prevent any surface water from entering the well. If ground water is found, it is expected to be found at the interface of the colluvium and bedrock strata. The well will be added to our regular well monitoring system. At the conclusion of mining, and at bond release, the casing will be cut off below ground level, the hole plugged with concrete grout, and the disturbed area revegetated.
