RE: Sunnyside Permit Update

Dear Mr. Whitehead:

Please find enclosed two copies of update material for the Sunnyside Permit. Twelve additional copies are being made at the printers and will be delivered to the Division this week. The update consists of bonding changes, a new soil borrow area, new industrial borrow areas and a new substation layout. The changes were made to correct errors that were found in the bond calculation and amount of borrow material listed as available in the previous MRP submissions.

The substation is located at the Methane Drainage Borehole east of the Manshaft Bathhouse and the water treatment plant. The power from the substation will power chargers and pumps in the Manshaft Dips area of the mine after the 19th Left Outside longwall pannel is extracted. Sediment controls for the site will be a silt fence which extends 10 feet around a culvert under the County road (see Plate III-39). After the transformers are placed in the substation there will be little or no activity on the site for the life of mine.

Sincerely,

Douglas C Pearce
