RE: Lila Canyon Significant Revision to the Horse Canyon Mining and Reclamation Plan, UtahAmerican Energy, Inc., Horse Canyon Mine, C/007/013-SR98(1)-6

**SUMMARY:**

UtahAmerican Energy, Inc., has submitted a significant revision to the plan for the Horse Canyon Mine. A new mine would be built in Lila Canyon to access coal reserves to the south of the current Horse Canyon permit area.

This is the Division's seventh technical analysis since finding the application administratively complete. The Division received this submittal on January 19, 2001. Previous submittals were received and reviewed as follows:

Original PAP submittal	September 8, 1998
Administratively incomplete, PAP returned	November 6, 1998
Resubmittal	December 14, 1998
Administratively incomplete	February 1, 1999
Resubmittal	February 11, 1999
Administratively Complete	February 25, 1999
1 <sup>st</sup> round - Technical Analysis w/ deficiencies	May 26, 1999
Resubmittal	July 30, 1999
2 <sup>nd</sup> round - Technical Analysis w/ deficiencies	October 18, 1999
Resubmittal	November 29, 1999
3 <sup>rd</sup> round - Technical Analysis w/ deficiencies	February 23, 2000
Resubmittal	March 10, 2000
4 <sup>th</sup> round - Technical Analysis w/ deficiencies	June 29, 2000
Resubmittal	September 25, 2000

6<sup>th</sup> round Technical Analysis with Deficiencies  
Resubmittal (this proposal)

March 9, 2001  
April 30, 2001

**TECHNICAL ANALYSIS:**

**GENERAL CONTENTS**

**OWNERSHIP AND CONTROL INFORMATION**

Regulatory Reference: R645-301-112

**Analysis:**

The applicant is UtahAmerican Energy, Inc., a Utah corporation. The application gives the name, address and telephone number of the applicant and its resident agent and includes the employer identification number for the applicant. UtahAmerican will pay the abandoned mine reclamation fee.

Section 112.300 of the application says ownership and control information is in Appendix 1-1, and Appendix 1-1 references Appendix 1-7 of Part "A" of the Horse Canyon mining and reclamation plan for ownership and control information. Section 112.340 says identifying information about affiliated coal mining and reclamation operations is in Appendix 1-2, and this appendix references Appendix 1-9 of Part "A" of the Horse Canyon plan for this information.

Most of this ownership and control information has been previously approved as part of the Horse Canyon mining and reclamation plan. Some of it is hard to follow, but it is possible to determine the corporate structure. While there are several affiliated companies, UtahAmerican Energy, Inc., is only owned by one company, Coal Resources, Inc.

The application is required to include the names, addresses, permit numbers, regulatory authorities, employer identification numbers, and MSHA numbers together with dates of issuance for coal mining and reclamation operations owned or controlled by the applicant or by any person that owns or controls the applicant, and this information is in Appendix 1-9 of the Horse Canyon plan and Appendix 1-1 of the current application. No permitted operations are shown for Coal Resources, Inc.; PennAmerican Coal, Inc.; AmCoal Holdings, Inc.; Mill Creek Mining Company; Pinski Corporation; American Coal Sales Company; West Virginia Resources, Inc.; Pennsylvania Transloading, Inc.; Sunburst Resources, Inc.; Ohio Valley Resources, Inc.; and Spring Church Coal Company. It is assumed these companies do not have associated coal mining and reclamation operations.

Section 112.500 of the text and Plates 4-1 and 5-4 show surface and coal ownership in and contiguous to both the existing permit area and the proposed addition. Section 112.500 of

the application includes the names and addresses of the surface and coal owners, and this information is consistent with the information on the plates.

The application shows MSHA identification numbers for both the Horse Canyon and Lila Canyon Mines and for the refuse pile. Apparently, an MSHA identification number is only required for the portion of the refuse pile that will hold coal processing waste whereas the definitions in R645-100 also include underground development waste as part of coal mine waste.

According to this section of the application, there are no lands, interests in lands, options, or pending bids on interests held or made by the applicant for lands contiguous to the proposed addition to the permit area. Plates 4-1 and 5-3 show federal leases to the south of the proposed addition to the permit area that are labeled "area of future mining."

**Findings:**

Information in the application is adequate to meet the requirements of this section of the regulations.

**VIOLATION INFORMATION**

Regulatory Reference: R645-301-113

**Analysis:**

According to the application, neither UtahAmerican Energy nor any subsidiary, affiliate, or persons controlled by or under common control with them has had a federal or state permit suspended or revoked in the past five years, and these same entities have not forfeited a performance bond or similar security. The application says Appendix 1-3 contains a list of violations received by affiliated companies for the past three years, but Appendix 1-3 says these violations are listed in Appendix 1-8 of the Horse Canyon mining and reclamation plan. It appears from this information there is one violation that has yet to be terminated and that administrative proceedings are ongoing.

Information in this and the ownership and control section will need to be checked in the applicant violator system, but it appears the application contains the required information to comply with R645-301-113.

**Findings:**

Information provided in the application is considered adequate to satisfy the requirements of this section of the regulations.

TECHNICAL MEMO

---

## RIGHT OF ENTRY

Regulatory Reference: R645-301-114

### Analysis:

UtahAmerican Energy leases 5544.01 acres of federal coal in six federal leases purchased in June 2000 from the Intermountain Power Agency. The Bureau of Land Management has approved transfer of the federal leases from Intermountain Power Agency to UtahAmerican. Table 4-2 contains complete acreage figures for federal, state, and private surface and mineral rights.

Parts of Sections 33 and 34, Township 15 South, Range 14 East, are in the current Horse Canyon permit area, and, according to Plate 5-4, they contain unleased federal coal. Therefore, while they may be considered part of the current permit area, the applicant has no right to mine these areas.

The applicant bases its legal right to enter and begin coal mining and reclamation operations in the surface facilities portion of the proposed addition to the permit area on two Bureau of Land Management letters contained in the application. The surface facilities would be built in Section 15 of Township 16 South, Range 14 East. The land is managed by the Bureau of Land Management, but it is not in the federal coal leases. The application includes copies of letters from the Bureau of Land Management indicating they are prepared to grant right of entry except that the case is in litigation and they are waiting for a decision from the Interior Board of Land Appeals whether to grant the appellants a stay. When this issue is resolved, the Bureau of Land Management will be in a position to grant the right of way.

The applicant has fulfilled the requirement to include a description of the documents upon which it bases its right of entry and so is in compliance with R645-301-114. However, before the applicant can begin construction in the surface facilities portion of the proposed addition to the permit area, it must obtain right of entry from the Bureau of Land Management.

The School and Institutional Trust Lands Administration (SITLA) commented that they administer lands in the current permit area (not the Lila Canyon Tract), including coal resources. However, the existing Horse Canyon plan is for reclamation only.

SITLA also commented that UtahAmerican Energy presently has no applications, leases, permits, rights of way, or rights of entry to conduct any activities on or within these lands. SITLA does not manage the coal resources within the proposed addition to the permit area, only the surface of some areas, so right of entry is not needed unless UtahAmerican needs surface access which is not proposed at this time.

**Findings:**

Information provided in the application is adequate to meet the requirements of this section of the regulations. The applicant has fulfilled the requirement to include a description of the documents upon which it bases its right of entry and so is in compliance with R645-301-114. However, before the applicant can begin construction in the surface facilities portion of the proposed addition to the permit area, it must obtain right of entry from the Bureau of Land Management.

Since there will be no surface mining and since none of the coal that will be mined is privately owned, no agreement regarding severed surface and mineral estates is required.

**LEGAL DESCRIPTION AND STATUS OF UNSUITABILITY CLAIMS**

Regulatory Reference: 30 CFR 778.16; 30 CFR 779.12(a); 30 CFR 779.24(a)(b)(c); R645-300-121.120; R645-301-112.800; R645-300-141; R645-301-115.

**Analysis:**

According to the application, the proposed addition to the permit area is not in an area designated as unsuitable for mining, and the applicant is not aware of petitions to designate the area as unsuitable. The Division is unaware of any designation of the area as unsuitable for mining. Mining operations will not be conducted within 300 feet of an occupied dwelling, but they would be within 100 feet of an Emery County road.

The application says UtahAmerican Energy has received permission from Emery County to construct mining facilities and conduct mining operations within 100 feet of the road and includes a letter from Emery County documenting this approval. The letter signed by Rex Funk says UtahAmerican is authorized to conduct mining activities within 100 feet of the public road. A 6-foot chain link fence needs to be installed adjacent to the road right of way near the surface facilities area.

Table 4-2 contains legal descriptions of both the current and the proposed addition to the permit area.

**Findings:**

Information provided in the application is adequate to meet the requirements of this section of the regulations. The applicant has gained approval from the public road authority to conduct mining and reclamation operations within 100 feet of a public road.

---

TECHNICAL MEMO

---

## PERMIT TERM

Regulatory References: 30 CFR 778.17; R645-301-116.,

### Analysis:

The permit term for which the applicant is applying is five years. The beginning of construction is planned for 2001 with mining operations ending in 2025. This assumes adjacent federal leases can be acquired. The application includes acreage figures for surface and subsurface federal, state, and fee lands.

A certificate of liability insurance meeting Division requirements is in Appendix 8-2 & 8-3.

No facilities or structures would be used in common with another coal mining and reclamation operation.

### Findings:

Information in the application is adequate to meet the requirements of this section of the regulations.

## PUBLIC NOTICE AND COMMENT

Regulatory References: 30 CFR 778.21; 30 CFR 773.13; R645-300-120; R645-301-117.200.

### Analysis:

Appendix 1-5 contains copies of the newspaper advertisement and proof of publication. The Division received a comment from one land owner expressing concern about the mine's potential effects on his water. There were no requests for an informal conference.

### Findings:

Information in the application is adequate to meet the requirements of this section of the regulations.

## **FILING FEE**

Regulatory Reference: 30 CFR 777.17; R645-301-118.

### **Analysis:**

The filing fee is not required for a significant revision.

### **Findings:**

Information in the application is adequate to meet the requirements of this section of the regulations.

## **ENVIRONMENTAL RESOURCE INFORMATION**

### **HISTORIC AND ARCHAEOLOGICAL RESOURCE INFORMATION**

Regulatory Reference: R645-301-411.140

### **Analysis:**

Appendix 4-1 of the application contains information from three cultural resource surveys, including one done specifically for the proposed facilities area. There are several cultural resource sites in the vicinity, but only an isolated artifact was found in the proposed disturbed area. One site is listed on the National Register of Historic Places. It is a tree in Horse Canyon inscribed by Sam Gilson, a prominent rancher and promoter of the uses of gilsonite.

The information in the application is considered adequate. Maps and reports on archaeological resources have been marked confidential..

There are no cemeteries in or within 100 feet of the proposed addition to the permit area, and it contains no units of the National System of Trails or Wild and Scenic Rivers system.

### **Findings:**

Information provided in the application is considered adequate to meet the requirements of this section of the regulations. The Division must keep confidential any information that would enable a person to locate any of the cultural resource sites.

TECHNICAL MEMO

## VEGETATION INFORMATION

Regulatory Reference: R645-301-321

### Analysis:

Appendices 3-1 and 3-2 contain vegetation information about the Horse Canyon and "South Lease" areas. Additional information is in the existing Horse Canyon plan. These studies were done in 1981, 1982, 1983, 1985, 1999, and 2000. With the exceptions of a study by Patrick Collins in Appendix VIII-1 in the current Horse Canyon plan and 1999 and 2000 vegetation inventories in Appendix 3-2 of the application, the application does not show who conducted the studies as required in R645-301-120. According to verbal information from the applicant, this information is no longer available.

The vegetation inventory done in 1999 is for the grass/shrub community and a corresponding reference area to the west of the proposed disturbed area. Predominant species in both areas were cheatgrass, Salina wild rye, snakeweed, blue grama, needle and thread grass, Indian ricegrass, galleta, and purple three awn. Total vegetative cover in the proposed disturbed area was 39.7%, and it was 44.8% in the reference area. The study includes a map showing the vegetation communities in relation to the proposed disturbance, but it does not show sample locations.

On November 28, 2000, vegetation cover was measured in the proposed disturbed pinyon/juniper community. Only ten samples were taken, but each sample was 0.01 acres, a relatively large sample plot. The mean cover value was 33.9%, and cover was dominated by Utah juniper with 80.0% relative cover. Other species included Salina wild rye, fourwing saltbush, prickly pear cactus, snakeweed, and galleta.

A table in the 1999 study shows woody plant densities in the proposed disturbed grass/shrub and pinyon/juniper communities and in the reference area. Densities were 6260, 1560, and 7200 stems per acre for these three communities, respectively. In the grass/shrub areas, 88% of the woody plants were snakeweed, a poisonous plant.

Appendix 3-7 contains productivity estimates done by George Cook, formerly of the Natural Resources Conservation Service, for the area proposed to be disturbed and associated reference area. Both the grass/shrub proposed disturbed and reference areas had production of about 850 pounds per acre, and the pinyon/juniper community had production of about 250-300 pounds per acre.

Mr. Cook rated the three areas as being in good range condition, but it is unusual for an area with 28% relative cover from cheatgrass to be considered in good range condition. It is possible that although cover from cheatgrass was high, production may have been low, and production is the parameter used in range condition assessments.

Vegetation cover, productivity, and woody plant density were the only parameters measured in the pinyon/juniper area. The applicant did not measure cover from rock, litter, or cryptogams. Regulation R645-301-321 requires only a description of the plant communities in the proposed disturbed area adequate to predict the potential for reestablishing vegetation. This regulation specifically includes productivity. The Division's guidelines recommend measuring cover from rock, litter, and cryptogams, but the Division does not feel this information is essential for predicting the revegetation potential for the site. The revegetation and soils reclamation plans have been designed to provide for surface rock cover, and other aspects of ground cover should become established as vegetation becomes established.

While the Division considers the information in the application to be adequate as baseline information, it is not adequate to use as a baseline revegetation success standard. A large enough area was sampled that the Division feels it adequately represents the proposed disturbed area, but the "Vegetation Information Guidelines," which are referenced in the regulations for methods for measuring revegetation success, give minimum sample size criteria that were not met in the baseline sampling. To apply a baseline revegetation standard, the Division would also need measurements of cover from litter that are not included in sampling the pinyon/juniper area.

Appropriateness of the reference area is discussed in the section of this review discussing revegetation success standards.

**Findings:**

Information provided in the application is considered adequate to meet the requirements of this section of the regulations.

**FISH AND WILDLIFE RESOURCE INFORMATION**

Regulatory Reference: R645-301-322

**Analysis:**

**Wildlife Information**

Wildlife habitat is discussed in Section 322.220, and Plate 3-1 shows habitat areas for elk, mule deer, Rocky Mountain bighorn sheep, pronghorns, and raptors. According to Plate 3-1, the proposed disturbed area contains habitat for Rocky Mountain bighorn sheep and mule deer, and pronghorns and raptors are nearby. The proposed addition to the permit area includes areas of critical habitat for elk and deer, but the proposed disturbed area does not include these habitats.

Raptor surveys were conducted in the area in 1990, 1998, 1999, and 2000. Plate 3-1 shows locations of five nests within about one mile of the proposed surface facilities, and

---

TECHNICAL MEMO

---

Appendix 3-5 contains further information, including results of the 2000 raptor survey. According to Plate 3-1, all of the nests near Lila Canyon were golden eagle nests. Section 322.220 says the entire permit area plus an area within 1 mile of the proposed surface facilities were surveyed for raptor nests. Plate 5-3 shows raptor nests and also includes subsidence limits, and this information is consistent with what is shown on Plate 3-1. According to Plate 5-3, two golden eagle nests would be within the subsidence area.

The applicant commits to conduct raptor surveys one year prior to all proposed new construction or potentially disruptive mining activity. This should be done in all suitable habitat within a one mile radius of these activities and needs to include the main facilities area. If any of the nests near the proposed facilities is active when the applicant begins construction, it may be necessary to delay the start of construction until the nest is no longer being used.

The application indicates the applicant has consulted with the Fish and Wildlife Service, the Division of Wildlife Resources, and the Bureau of Land Management concerning raptor nests in the vicinity of the mine. They determined there is a high probability golden eagle nests near the surface facilities would be abandoned.

Information about other wildlife species includes a statement that many birds of high federal interest would not inhabit the area because the intermittent stream channels lack riparian vegetation. The application also references a Division of Wildlife Resources publication entitled "Fauna of Southeastern Utah and Life Requisites Regrading their Ecosystems." This publication is available to the Division, and it contains general information about species in the area.

### **Threatened and Endangered Species**

Table 3-1 lists seven threatened or endangered species the application says may occur in Emery county or that could be affected by the mine. Appendix 3-3 contains a letter from the Fish and Wildlife Service listing threatened and endangered species that occur in Emery county.

The proposed addition to the permit area contains habitat for some species on the list of threatened or endangered species in Emery county, but these species have not been found. Each species occurring in Emery county is discussed below.

The Fish and Wildlife Service commented that the applicant needs to assess vegetation in the proposed addition to the permit area to determine whether southwestern willow flycatcher habitat exists. According to their letter, breeding habitat is typified by areas of dense willow or willow mixed with a variety of riparian shrubs and small trees.

The application documents that the proposed addition to the permit area does not contain habitat for southwestern willow flycatchers. There are no perennial water sources or riparian areas in either the current permit area or the proposed addition, and according to verbal information from the applicant's consultant, there are few, if any, willows or similar riparian-type

vegetation associated with the seeps and springs in the proposed addition to the permit area. There may have been a few willows or shrubs, but there were no dense patches as would be required by southwestern willow flycatchers.

Bald eagles are fairly common winter residents of Utah, and they could visit the area. However, they generally like to roost in large trees that do not exist in the proposed disturbed area. Therefore, it is unlikely they will be adversely affected.

Four fish species of the Upper Colorado River drainage are listed as threatened or endangered, and although the mine would not affect them directly, water usage has been determined to adversely affect these species. As discussed in the fish and wildlife protection part of this review, the mine is expected to use about 21.3 acre-feet of water annually, including water lost through mine ventilation. Mitigation is required when the annual depletion exceeds 100 acre-feet.

Black-footed ferrets have historically been found in eastern Utah, but, with the exception of the population recently reintroduced to the Uintah Basin, there have been no confirmed sightings in recent years. If any were in the area, it is most likely they would be affected by road construction.

(Information in the following discussion on the distribution of plants is from *A Utah Flora* or is verbal information from Bob Thompson, a botanist with the Forest Service.)

Barneby reed-mustard (*Schoenocrambe barnebyi*) grows at elevations of about 5600 to 5700 feet on the Chinle formation. The proposed disturbed area is at a higher elevation, and it does not contain the Chinle formation. Therefore, the area is not considered habitat for this species.

The reported elevation range for Jones cycladenia (*Cycladenia humilis* Var. *jonesii*) overlaps the proposed disturbed area, but it grows in sandy gypsiferous soils derived from the Cutler, Summerville, and Chinle formations, and these are not found in the proposed addition to the permit area.

Last chance Townsendia (*Townsendia aprica*) grows in salt desert shrub and pinyon-juniper communities on clay or clay-silt exposures of the Mancos Shale. It has been found mainly in the Fremont Junction area and not on the east side of the San Rafael Swell.

The Maguire daisy (*Erigeron maguirei*) has only been found in a few places in the San Rafael Swell and in Capitol Reef National Park in canyon bottoms in the Wingate and Navajo Sandstone formations. There is essentially no possibility this species could occur in the proposed addition to the permit area.

---

TECHNICAL MEMO

---

Three cactus species are included on the Fish and Wildlife Service list. The San Rafael cactus or Despain footcactus (*Pediocactus despainii*) is very difficult to find and grows in open pinyon/juniper communities in and on the edges of the San Rafael Swell. This is the type of habitat in the proposed disturbed area, and, according to Bob Thompson of the Forest Service, there is potential this species could occur in the area. However, the application indicates the applicant's consultant searched for this plant and did not find it.

According to Mr. Thompson, the Wright fishhook cactus (*Sclerocactus wrightiae*) also has potential of occurring in the area. It grows in salt desert shrub and grass/shrub to juniper communities in soil derived from Mancos Shale and other formations. The applicant's consultant also searched for and did not find this species.

The Winkler cactus (*Pediocactus winkleri*) is a tiny plant that grows in salt desert shrub communities at lower elevations than those in the proposed disturbed area. Its distribution is more to the west, and it is unlikely it occurs in the proposed addition to the permit area.

The Division received comments from the Fish and Wildlife Service dated April 14, 1999, and further comments dated October 14, 1999. They felt the Division had adequately responded to their concerns and did not disagree with the Division's findings concerning threatened or endangered species.

**Findings:**

Information in the proposal is adequate to meet the requirements of this section of the regulations.

**LAND USE RESOURCE INFORMATION**

Regulatory Reference: R645-301-411

**Analysis:**

Premining land uses of the proposed addition to the permit area include grazing, wildlife habitat, coal mining, and limited recreation. Grazing allotment boundaries are shown on Plate 4-2, and wildlife habitat is shown on Plate 3-1. Production in the grazing allotments in terms of animal unit months is shown in Table 4-3.

Boundaries of the Turtle Canyon Wilderness Study area and the areas identified in the 1999 wilderness inventory as having wilderness characteristics, both discussed below, are shown on Plate 4-4.

According to the application, Lila Canyon is within an area identified by the Bureau of Land Management as the Range Valley Mountain Habitat Management Plan Area. A habitat management plan was adopted in 1991 to provide management for various wildlife and for access management.

The proposed addition to the permit area does not support a wide variety of land uses because of the limited access and remote location, rugged topography, limited soils, and lack of rainfall and surface water. Water rights are discussed in Chapter 7, and water uses include stock watering and various uses for coal mining.

The land is zoned by Emery County for mining and grazing. A small portion of the proposed permit area addition overlaps with the Turtle Canyon Wilderness Study Area. The application contains a copy of the 1993 environmental assessment prepared for management of the Turtle Canyon Wilderness Study Area, and it says underground mining would be acceptable in this area.

The Bureau of Land Management's 1999 Utah Wilderness Inventory identifies areas with wilderness character in addition to the previously-identified wilderness study areas. One of these areas overlaps the proposed addition to the permit area including the proposed disturbed area. The application includes copies of two memoranda from the Bureau of Land Management. One of these says, "While the planning process is being completed on lands found to have wilderness characteristics in the 1999 Wilderness Inventory, the management prescriptions of existing land management plans do not change." Therefore, it appears the Bureau of Land Management will be managing these lands as in the past until further assessment has been completed.

There has been some previous mining activity in Lila Canyon, but it is unknown how much coal was mined. The road on the bottom of Lila Canyon was built in the 1950's to provide access for coal exploration. There is a sealed portal in the left fork of the canyon where the Sunnyside Seam was exposed and coal mined, and the coal was probably transported back through the Horse Canyon Mine. It is believed mining occurred during the 1970's or early 1980's. If mining occurred during this time period, it should have been regulated under Title V of SMCRA.

### **Findings:**

Information provided in the application is adequate to meet the requirements of this section of the regulations.

TECHNICAL MEMO

---

## MAPS, PLANS, AND CROSS SECTIONS OF RESOURCE INFORMATION

Regulatory Reference: R645-301-411.141, R645-301-323

### Archaeological Site and Cultural Resource Maps

The locations of cultural and historic resources in the area are shown on Plate 4-3 and on maps in Appendix 4-1. This information is adequate but needs to be kept confidential.

### Vegetation Reference Area Maps

Figure 1 in Appendix 3-2 is a map showing the vegetation communities and the reference area in relation to the proposed disturbance, and Plate 3-2 shows vegetation communities of the proposed addition to the permit area.

### Findings:

Information provided in the proposal is adequate to meet the requirements of this section of the regulations.

## OPERATION PLAN

### PROTECTION OF PUBLIC PARKS AND HISTORIC PLACES

Regulatory Reference: R645-301-140

### Analysis:

The proposed addition to the permit area contains no known cultural resources listed or eligible for listing in the National Register of Historic Places, public parks, or units of the National System of Trails or the Wild and Scenic Rivers system. Therefore, no protection plan is needed.

On September 22, 1999, March 8, 2001, and March 27, 2001, the Division wrote letters to the State Historic Preservation Office (SHPO) requesting their concurrence with the project. Because the Division did not receive a response, a Division representative visited the office of the Division of State History on April 18, 2001. Jim Dykman of SHPO told this representative that since SHPO did not respond within 30 days of the Division's letters, SHPO had concurred with the Division's conclusion that there would be no effect on historic properties. This visit is documented in a memorandum to file dated April 18, 2001.

The Turtle Canyon Wilderness Study Area overlaps with the proposed addition to the permit area in the following locations:

Township 16 South, Range 14 East  
Section 13, E $\frac{1}{2}$  NW $\frac{1}{4}$ , NE $\frac{1}{4}$   
Section 24, NE $\frac{1}{4}$  NW $\frac{1}{4}$ , N $\frac{1}{2}$  NE $\frac{1}{4}$

Township 16 South, Range 14 East  
Section 19, SE $\frac{1}{4}$  SW $\frac{1}{4}$ , Lots 3 and 4  
Section 30, SW $\frac{1}{4}$  NE $\frac{1}{4}$

The policy of the Bureau of Land Management is to not allow surface occupancy in wilderness study areas any more than absolutely necessary and only in cases where there are valid existing rights. The applicant has not proposed surface-disturbing activities in these areas, and considering the topography, the Bureau of Land Management feels it is unlikely exploration, ventilation shafts, or other disturbance would be practical. If the applicant proposes surface-disturbing activities in these areas, they will be scrutinized very carefully.

The Bureau of Land Management has prepared two environmental analyses discussing the anticipated effects of subsidence in these areas. If subsidence is expressed on the surface, it is likely to consist of a lowering of the land elevation with some surface cracks, and there could be some disruption of the hydrologic balance. Overall, however, the Bureau of Land Management feels the effects of undermining these areas would be small.

The "Land Use Resource Information" section of this analysis discusses the 1999 Utah Wilderness Inventory. According to information from the Bureau of Land Management and contained in the application, the land will not be managed as a wilderness study area until further analyses have been completed.

**Findings:**

Information provided in the application is adequate to meet the requirements of this section of the regulations. The Division finds there would be no effects on historic properties, and the Division of State History has concurred with this determination.

**AIR POLLUTION CONTROL PLAN**

Regulatory Reference: R645-301-420

**Analysis:**

Appendix 4-3 contains a copy of the Air Quality Approval Order from the Division of Air

**TECHNICAL MEMO**

---

Quality. A letter in Appendix 4-3 from Jay Marshall to the Division of Air Quality says the applicant was requesting approval for a throughput of up to 2,000,000 tons per year, but the Approval Order says up to 1,500,000 tons of coal could be mined in a rolling twelve month period. Section 523 of the application indicates production should be between 1,000,000 and 1,500,000 tons per year for the first five years but that production could peak at 4,500,000 tons. Therefore, the application is consistent with the Air Quality Approval Order for the first five years. Any increase in production after five years would require amendments to both the Air Quality Approval Order and the mining and reclamation plan.

**Findings:**

Information provided in the application is adequate to meet the requirements of this section of the regulations.

**FISH AND WILDLIFE INFORMATION**

Regulatory Reference: 30 CFR Sec. 784.21, 817.97; R645-301-322, -301-333, -301-342, -301-358.

**Analysis:**

**Protection and Enhancement Plan**

In Section 333, the application says the major impacts to wildlife in and around the mine will be the loss of habitat during construction and through the life of the mine. It also says most wildlife will either accept the mine or adjust behavior to coexist with the operation.

Operational impacts, such as collisions with mine-associated vehicles, loss of habitat during the life of the mine, wildlife disturbance, and fragmentation of nearby habitat, are difficult to quantify but would be the greatest impacts from the mine. The Fish and Wildlife Service commented that the mine's disturbance would kill most burrowing animals and others that are less mobile. It would also result in habitat fragmentation and dislocation of some animals to less desirable or already-occupied areas. Although wildlife can coexist with mining operations, animals may be forced to adjust their behaviors and may be otherwise stressed in ways that reduce their chances for survival

The applicant has committed to train mine employees annually on environmental awareness. This will include wildlife protection measures, such as avoidance during stress periods, caution in driving, recognition of threatened or endangered species, and instructions to remove wildlife carcasses well off the road to avoid collisions with scavenging raptors. Wildlife Resources will be notified of any large game killed on the road, and the applicant will request that they be moved to safeguard raptors. The applicant will instruct personnel as to current regulations pertaining to off road vehicle and firearm use.

All suitable water encountered during mining will be discharged in a manner that it becomes available to wildlife. The applicant will need to ensure the water rights allow for this use and that the water quality is satisfactory. The water rights listed in Table 7-2 indicate the uses are for "mining" and "other." Ensuring that water quality is suitable should be possible through testing required for the discharge permit.

The application discusses the possible benefits of water in the sediment pond to wildlife. In the event water in the pond contains materials hazardous to wildlife, it would be removed and the pond monitored to ensure no negative effects on wildlife.

Wildlife Resources indicates there are bighorn sheep that spend all year in the Lila Canyon area, and use by sheep is expected to be curtailed following construction. Wildlife Resources also commented that Lila Canyon, and more particularly the water sources up the canyon, are heavily used by chukars, and they feel the mining operations will affect these birds. They suggested the applicant install some watering structures of a suitable design and said these water sources would greatly benefit chukars and other area wildlife. Bighorns would presumably be among the wildlife that would benefit from guzzlers. According to the application, the applicant has agreed to install two guzzlers. Designs are available for guzzlers that blend into the surrounding area extremely well and require almost no maintenance.

The conveyor from the rock tunnel to the run of mine coal stockpile is adequately elevated to not restrict movements by large mammals. Other conveyors are close enough to loadout and other facilities that it is unlikely large mammals will use these areas.

The only fence shown on the surface facilities map would be along the road. It is about 1000 feet long. Big game tend to use drainage corridors for migrational movements, and although there are some minor drainage that come into the surface facilities area, the major drainage in this area is Lila Canyon. The Lila Canyon drainage is to the north of the surface facilities, and any big game movements in this area would not be restricted by the fence. Therefore, the Division has determined the application meets the requirements of R645-301-358.520.

The applicant commits to use power lines designed using the best technology available to protect raptors from electrocution hazards. Although the application does not contain specific designs for these power lines, the Bureau of Land Management's environmental analysis does. Based on this information, the Division has determined the application complies with the requirements of R645-301-358.510.

The applicant has also agreed to participate in a habitat enhancement project on about 70 acres to convert this from pinyon-juniper woodland to shrubs, forbs, and grasses. Wildlife Resources feels the conversion from pinyon-juniper to a grass/shrub community would profit both big game and raptors. In their experience, jackrabbit and cottontail rabbit populations increase markedly with this change in vegetation, and they believe this would greatly benefit raptors.

---

TECHNICAL MEMO

---

As the mitigation projects are completed, some details should be included in the application or mining and reclamation plan. If this does not happen, it is easy to lose track of what was accomplished. If the applicant or anyone else visits the mitigation sites, general comments on use should be noted and reported to Wildlife Resources and the Division.

### **Endangered and Threatened Species and Bald and Golden Eagles**

In a letter dated April 28, 2000, the Fish and Wildlife Service concurred with the Division's findings that the project is not likely to affect the southwestern willow flycatcher, the bald eagle, or listed threatened or endangered plant species. Any water depletions from the Upper Colorado River Basin are considered to jeopardize the continued existence or adversely modify the critical habitat of four Colorado River endangered fish species, but depletions are addressed by existing inter-agency section 7 agreements. No mitigation is required for annual depletions under 100 acre-feet, and since the depletion resulting from the mine is expected to be about 21.3 acre-feet, no mitigation is required at this time.

The Fish and Wildlife Service commented in a letter dated April 14, 1999, that there should be an evaluation of effects on the Colorado pikeminnow (formerly the Colorado squawfish) of a water discharge line to the Price River. This discharge line was apparently proposed early in the planning process for the mine, but it is no longer being planned.

The applicant commits to establish a one-half mile buffer zone of no disturbance during critical nesting periods. This is adequate to protect eggs and chicks from abandonment, and this commitment combined with the mitigation discussed above should be adequate for the loss of most nests near the mine. If any nests are active when the applicant plans to begin construction, it might be necessary to delay construction until the nesting season has ended.

Section 358.200 contains a commitment to safeguard any escarpment that has been identified as a raptor nest site; however, it appears there are two nests within the subsidence area shown on Plate 5-3. These nests are shown on Plate 3-1 as #820 and 946 (one nest) and #719. The Division assumes these nests could actually be lost, not just not used.

The Division consulted with the Fish and Wildlife Service and the Division of Wildlife Resources about the potential loss of nests in the area, and it was agreed the applicant should commit to providing alternative nest sites if a nest is lost as a result of subsidence. In Section 322.220, the application says that if a nest is lost through subsidence, the applicant will work with the Fish and Wildlife Service and the Division of Wildlife Resources to analyze the potential and construction of alternative nest sites. This commitment is considered to be adequate.

It is possible the nests that will be undermined could be used in spite of their proximity to the mine. For this reason, it will be necessary to monitor the sites near the time when they would be undermined. It might be necessary to preclude birds from using the nests when subsidence is expected.

In Section 358.200, the applicant commits to conduct a raptor survey to ensure that raptors or their nests or young will not be adversely affected though any mining or mine-related activity. If any previously unknown nests are found, it may be necessary to develop protection or mitigation plans.

Since no threatened or endangered species are known to occur in the proposed addition to the permit area, no protection or mitigation measures are needed.

R645-301-358.510 requires that the operator ensure that power lines used for or incidental to coal mining and reclamation operations within the permit area be designed, constructed and maintained to minimize electrocution hazards to raptors. The application contains a commitment to this effect. The Fish and Wildlife Service recommends application of power line designs such as those in the Avian Power Line Interaction Committee's "Mitigating Bird Collisions with Power Lines: the State of the Art in 1994," or "Suggested Practices for Raptor Protection on Power Lines: the State of the Art in 1996," prepared for the Edison Electric Institute/Raptor Research Foundation, Washington, D. C.

#### **Wetlands and Habitats of Unusually High Value for Fish and Wildlife**

The application says the proposed disturbed area contains critical winter range for deer and elk, and it discusses a mitigation plan for the habitat that would be lost during the life of the mine. The "Protection and Mitigation Plan" section of this review discusses this issue further.

According to the application, there are no wetlands or riparian areas within the proposed addition to the permit area. While there are a few springs in the area, there are no perennial drainages.

#### **Findings:**

Information provided in the application is adequate to meet the requirements of this section of the regulations.

The Division finds that the applicant has complied with the requirements of R645-301-358.510 and R645-301-358.520 to properly design and locate power lines, fences, and conveyors.

The Division also finds that there is not likely to be any adverse effect to any threatened or endangered species with the exception of four fish species of the Upper Colorado River Basin: the Colorado pikeminnow, the humpback chub, the bonytail chub, and the razorback sucker. While water consumption by the proposed operation would consume about 21.3 acre-feet of water annually and thus jeopardize the continued existence of or adversely modify the critical habitat of these species, existing inter-agency section 7 agreements address these concerns. The Fish and Wildlife Service has concurred with these findings.

TECHNICAL MEMO

---

## VEGETATION

Regulatory Reference: R645-301-330, -301-331, -301-332.

### Analysis:

All incidental disturbances that will not be used as part of the operations will be revegetated with an interim seed mix. Table 3.4/3.5 is a seed mix that would be used for both interim and final revegetation. While this seed mix should provide adequate erosion protection for both interim and final reclamation, the Division recommends the applicant include one or more rhizomatous grass species to enhance vegetation cover and erosion control further.

Section 331 refers to the revegetation plan in Section 340 for further information about revegetation methods. The details of this plan are discussed under "Revegetation" below.

### Findings:

Information provided in the proposal is adequate to meet the requirements of this section of the regulations.

While the species in the seed mix should be adequate for interim revegetation, the Division recommends adding at least one species of rhizomatous grass, such as western wheatgrass or thickspike wheatgrass.

## SUBSIDENCE

Regulatory Reference: R645-301-332

### Analysis:

According to the application, the main potential effects of subsidence would be escarpment failure and disruption of surface and ground water. According to Plate 5-3, one eagle nest is in the subsidence area. Protection of this nest or mitigation for its loss is discussed in detail in the section of this analysis dealing with the fish and wildlife protection plan.

Section 525.100 says limited renewable resource lands exist within the area surveyed and that limited areas were found that contribute to the long-range productivity of water supply or fiber products.

The value of the lands within the proposed addition to the permit area as renewable resource lands is discussed elsewhere in the application; however, there is no indication any of the land is not within the definition of renewable resource lands.

According to the application, ground water will probably be intercepted in the course of mining, but it is not known whether it is perched or an active recharge aquifer. If the mine was to discharge water, it could benefit wildlife, at least through the life of the mine.

The mitigation for losses of wildlife habitat through subsidence could include habitat enhancement to increase production of selected forage species, and development of off-site water sources, such as guzzlers.

Subsidence cracks are occasionally large enough to be dangerous for wildlife, livestock, and people that might be in the area. The applicant has committed in Sections 525.160 and 525.231 to restore to the extent technologically and economically feasible material damage to the surface lands. This commitment is in accordance with regulatory requirements and is considered adequate.

A standard stipulation on federal leases is that the lessee monitor the effects of underground mining on vegetation. The application includes a plan to monitor vegetation with color infrared photography every five years. This commitment is consistent with commitments other mines have made and is acceptable.

**Findings:**

Information provided in the application is adequate to meet the requirements of this section of the regulations.

## **RECLAMATION PLAN**

### **LAND USE RECLAMATION PLAN**

Regulatory Reference: R645-301-412

**Analysis:**

The postmining land uses will be the same as premining land uses. This will be accomplished through the reclamation plan presented in other sections of the application. Support activities to achieve the postmining land uses will include site monitoring; remedial actions, such as regrading, reseeding, and replanting; and fencing as necessary to restrict access and grazing.

The postmining land use is in accordance with the Bureau of Land Management's management plans. Appendix 4-2 contains a letter from the Bureau of Land Management stating the postmining land use for the area is wildlife habitat, grazing, and incidental recreation.

**TECHNICAL MEMO**

---

**Findings:**

Information provided in the proposal is considered adequate to meet the requirements of this section of the regulations.

**CONTEMPORANEOUS RECLAMATION**

Regulatory Reference: 30 CFR Sec. 785.18, 817.100; R645-301-352, -301-553, -302-280, -302-281, -302-282, -302-283, -302-284.

**Analysis:**

Contemporaneous reclamation is required as a performance standard. Because this is an underground operation, a schedule for contemporaneous reclamation is not required.

**Findings:**

Information in the application is adequate to meet the requirements of this section of the regulations.

**REVEGETATION**

Regulatory Reference: R645-301-341

**Analysis:**

**Revegetation Plan**

Table 3-3 in Chapter 3 is a general reclamation timetable. According to this timetable, seeding and mulching would begin about the first of October, depending on the weather, and seedlings would be planted about the first of November. Except as discussed below, these are the normal times for planting, and the schedule is acceptable.

Blue grama and galleta are two of the dominant grasses in the area proposed to be disturbed, and they are both warm season grasses. Other mines in Utah have found it difficult to establish these species on reclaimed sites, and this may be because they are often seeded in the fall. Mines in New Mexico and Arizona usually seed these species in the summer to take advantage of late summer rains, but, to the Division's knowledge, no Utah mines have attempted to establish these species by planting them in the summer.

The applicant has committed to establish test plots to test whether summer seeding will increase establishment of the warm season species. With this commitment, the Division is

willing to accept the plan to seed in the fall. Further details of the test plot plan are discussed in the "Field Trials" section of this analysis.

Following demolition, the area would be regraded to approximate original contour. These areas will then be ripped 16-18 inches deep and disced. Topsoil will then be distributed to depths from six to eighteen inches as discussed in Chapter 2.

It is vital that there be soil for plants to have adequate rooting depth. Studies of plant phenology have clearly shown plants in arid areas use soil water from increasing depths as the growing season continues, and if there is inadequate rooting depth, production and vegetative cover will decrease.

Any soils not salvaged and protected would be subject to contamination from mine operations, compaction, and mixing with unsuitable materials. Some of the deeper subsoils, below the roots, have very high (>65%) rock contents, and some are derived from marine shales that could severely limit vegetation establishment and growth. If these materials were in the rooting zone, it would be difficult or impossible to achieve revegetation success.

Following topsoil redistribution, the soil will be tilled until large clods on the surface are diminishing. Tilling the soil to reduce the number and size of clods has not been necessary at other Utah mines because clods are broken up as the soil is redistributed, but a limited amount of tilling would probably not be detrimental. Gouging or pocking (see below) would also serve to break up large clods.

According to Section 553.230, surface preparation will include pock marking to minimize the potential for erosion and to enhance vegetation establishment. Because of the limited precipitation, the Division considers surface roughening to be essential at this site. Diagrams of pock mark configurations are shown in Figure 1 in Appendix 5-8.

Appendix 5-8 says that in conjunction with pock marking, the track hoe can cast any vegetation, dead trees, and large rocks back onto the reclaimed surface. This debris provides solar protection but also increases available moisture in small areas and increases topographic and vegetation diversity.

The seed mixture for final reclamation is shown in Table 3.4/3.5. It consists of 22 species, 19 of which are native to the area. The introduced species are yellow sweet clover, alfalfa, and prostrate kochia, and the application discusses the reasons for using these species. Based on the reasons in the application, the Division can allow using these three species.

There is controversy whether yellow sweet clover should be included for revegetation, but the applicant would apply it at a rate of only 0.5 pounds per acre. At this rate, it should not dominate the site or spread to adjacent areas. The application says yellow sweet clover has proven beneficial in rapid establishment on marginal sites and that, as a legume, it should be able to fix nitrogen. The application includes a commitment to use inoculated seed.

TECHNICAL MEMO

---

Alfalfa was recommended by the Division of Wildlife Resources, and because this site is marginal for alfalfa, it should not be overly aggressive. Forage kochia is desirable as a forage species and because there is evidence it competes well with downy brome, a weed that dominates much of the proposed disturbed area.

The seeding rate shown in Table 3.4/3.5 is about 125 seeds per square foot. This is a little higher than the rate recommended by the *Interagency Forage and Conservation Planting Guide for Utah* but is acceptable.

Appendix 5-8 says that if seeding does not result in shrub densities exceeding the success standard, bare root or containerized seedlings may be planted at a rate of approximately 200 per acre. The ratio and species would be determined by the Bureau of Land Management and the Division of Wildlife Resources. The application gives adequate details of when and how seedlings would be planted.

If the applicant plants any seedlings, the species and rates would need to be approved by the Division and this information included in the application or mining and reclamation plan. The discussion in the application is for a conceptual plan, and although the Division can approve the concept as written, details would need to be approved before being implemented.

Section 341.220 says seed will be broadcast with a hydroseeder. Fertilize3r will be broadcast, but the application does not give a specific application method. Fertilizer should not be included with seed during hydroseeding operations. The site will be mulched with 2000 pounds per acre of wood fiber mulch with 100 pounds per acre of a tackifier. Appendix (which was not modified in the September 2000 submittal) says 500 pounds per acre of wood fiber mulch and 100 pounds per acre of tackifier will be applied with the seed followed by application of an additional 1500 to 2000 pounds per acre of mulch and 100 pounds of tackifier. While Appendix 5-8 presents detail not included in Chapter 3, the Division considers the plans to be consistent.

There will be no irrigation, and no pest or disease control measures are planned. The Division does not anticipate irrigation will be necessary as long as water harvesting methods are used. There are no serious pest control problems in the area of which the Division is aware, so, hopefully, no control measures will be necessary.

Section 357.301 says the Lila Canyon Mine would like to reserve the right to apply for augmentation of reclaimed areas thus extending the bond liability period on a site specific case scenario. This statement is acceptable but unnecessary. The regulations in R645-301-357 are designed to allow a limited amount of reseeding and other work for specific purposes without lengthening the extended liability period.

### Success Standards

The reference area for the mine site disturbance was established adjacent to the proposed facilities during the summer of 1999. Its location is shown on Figure 1 in Appendix 3-2.

The grass/shrub reference area is similar in most respects to the proposed disturbed grass/shrub areas, and it is considered an acceptable success standard. At the time of final reclamation, the range condition of the reference area will need to be reevaluated to ensure it is still in fair or better range condition. In the meantime, the reference area needs to be marked and should not be disturbed without first designating another revegetation success standard. The Division recommends the reference area be checked every five years to help ensure it remains in fair or better condition.

The applicant is proposing to use the grass/shrub reference area as a success standard for the pinyon/juniper community. The pinyon/juniper area has statistically less vegetation cover than the reference area, so this may be a difficult standard to meet. However, reclaiming to a grass/shrub community would enhance the amount of forage available for both wildlife and grazing. A pinyon/juniper community would generally provide more cover for some wildlife species, but forage tends to be more limiting in this area than cover. Therefore, the Division considers this proposal to be acceptable.

The Division is required in R645-301-356.230 to consult with the Division of Wildlife Resources and gain approval for the tree and shrub density standard for success. The standard set in consultation with Wildlife Resources is 1500 per acre, and this standard has been included in the application. The standard was based more on the species expected to become established in the area than on the existing vegetation.

Section 341.250 discusses success standards for diversity, seasonality, and erosion control. To judge diversity, every species with more than 20% frequency would be classified into a life form. The standard is that the reclaimed area must have at least as many species in each life form, except introduced and undesirable species, as the reference area. The reclaimed and reference areas would not need to have exactly the same species. Life form categories would be native grass, native broadleaf forb, native shrub, desirable introduced, and undesirable species. Undesirable species are those generally classified as weeds or that are poisonous to livestock or wildlife. For seasonality, the life form categories would simply be warm and cool season. This is a relatively easy standard to measure and is acceptable.

Although the numbers may be different when reference area vegetation is measured for bond release, the diversity standard according to information gathered in 1999 would be two shrub species, one broadleaf forb, and six grasses. In addition, two undesirable species were encountered with greater than 20% frequency. There were three warm season species, five cool season, and one species (purple three-awn) about which no information on seasonality was found.

---

TECHNICAL MEMO

---

The proposed erosion standard is that vegetation will have demonstrated its erosion control effectiveness when UPDES effluent standards are met. All drainages leading away from the permit area would be sampled as often as practical. This standard is considered acceptable.

### **Field Trials**

The application says the methods outlined have a proven performance based on the successful reclamation of the Horse Canyon Mine. Section 354 discusses timing of seeding for blue grama and galleta. The applicant will use these species in the interim seed mix adjacent to the sediment pond. The west half of the pond disturbance will be seeded in mid-summer following construction. The east half will be seeded in the late fall. The line separating these two areas will be staked, and ocular estimates of reclamation success will be taken each fall for three years. If there appears to be a difference in the two areas, quantitative samples will be taken. If it is possible to derive a conclusion about timing of seeding, the reclamation plan can be modified at the time of permit renewal.

### **Wildlife Habitat**

The application says the sediment pond will be maintained through the life of the operation and will be removed when effluent criteria are met after reclamation. Sections 761 and 763.100 indicate the sediment pond will remain in place until the stability and vegetation requirements for Phase II Bond Release are met and that this will be a minimum of 2 years after the last augmented seeding.

A water source in this area would serve as a wildlife habitat enhancement; however, it is not known whether the pond would actually contain water a significant part of the year and would thus serve as an enhancement. It is also not known whether the water quality would be suitable for wildlife use. Even if it does contain water, the enhancement would only be temporary.

The species in the seed mixture will potentially provide good forage and cover for wildlife. The pinyon/juniper area will be reclaimed to a grass/shrub community, and this should enhance the quality of habitat in the area. There are plenty of pinyon/juniper areas nearby to provide cover, but the greatest need is the increased forage that would be provided in a grass/shrub area.

### **Findings:**

Information provided in the proposal is considered adequate to meet the requirements of this section of the regulations. Using the techniques described in the application, the Division considers that revegetation is feasible at this site.

**RECOMMENDATIONS:**

The applicant has provided required information, and the application can be approved. However, before the applicant can begin its mining and reclamation operations in the surface facilities area, it must obtain right of entry from the Bureau of Land Management.
