**9. Protection of Fish, Wildlife and Related Environmental Issues**

The reference area and sites #15 and# 17 had signs of deer. Site #14 we saw a chukkar.

**13. Revegetation**

The MRP success standard at this time is set for 3000 plants/acre. The 2004 vegetation survey showed that the reclaimed sites are below this standard (1957 to 5180 with average at 2709 plants per acre). The Permittee would like to lower the standard to 2000 for Phase III bond release. DWR, DOGM, and the Permittee walked the reference and reclaimed sites to evaluate whether the plant density and species are adequate for the postmine landuse - wildlife and grazing. The final determination is that all the sites are adequate for wildlife. Cheatgrass could be the cause of degradation of the sites because of its potential fire danger. This concern is true for all the reclaimed sites, particularly sites # 11, 13, 14.

**22. Other**

The chain link fence along the eastern edge of the old main facilities site had a hole cut large enough for easy access.
