## OPERATING PLAN FOR BANNING SIDING

### SIGNS AND MARKERS

Signs identifying the loadout area shall be posted, as required.

### SEDIMENT CONTROL PLAN

All surface drainage from the disturbed loadout area shall be contained within the permit area by means of berms and other related diversion structures.

### REASONS FOR APPROACH:

1. Containment of the 10 year-24 hour storm within the permit area, as requested by the Division, can be accomplished by using berms around the disturbed area.
2. All natural drainage outside of the disturbed area will remain unaffected.
3. The disturbed area is very flat and dry. Therefore, runoff will be minimal.
4. Because of the flat characteristic of the ground, extensive work would have to be done in order for the property to drain to a single point. This would also mean that any sedimentation pond would have to be totally incised. In turn, this would cause a very serious problem because the water table is high in the area and groundwater would most likely be encountered during excavation. It all adds up to an uneconomical alternative to use a sedimentation pond.

### SURFACE WATER MONITORING

A surface water monitoring plan is not necessary at the loadout because there is no discharge from the disturbed area.

### GROUNDWATER SYSTEMS

Groundwater will be covered in the water monitoring plan written by Vaughn Hansen Associates for both the mine and loadout permit areas.

### REVEGETATION

Revegetation shall occur on disturbed areas which are no longer in use.

NOTE: Two areas at the loadout which are no longer used for coal storage will be reseeded in the fall of 1979.

### RECLAMATION PLAN: POSTMINING LAND USE

Upon completed useage of the loadout facility:

1. All structures will be torn down and removed.
2. The entire disturbed area will be reclaimed to its premining land use.

### AIR QUALITY

1. Air quality standards will be adhered to for the load-out facility.
2. Dust control practices will always be implemented so as to minimize the amount of fugitive dust.
