**Subject:** 0070035 Sunnyside Outgoing Excess Spoil Pile #2 reclamation clarification

Rusty,

I would like to clarify a point that may be confusing from my last email. The use of lesser cover assumes that there is no acid/toxic characteristics in the excess spoil pile #2 surface layers. The testing of excess spoil pile #2 presented in the 2010 annual report does not include acid/base accounting or meaningful SAR, B or Se analysis (because of the analytical procedures used). Prior to using lesser cover, the pile needs to be re-sampled for these parameters. I re-read Scott's message and noted that his plans were for four feet of cover. If that is the case, no further sampling of Excess Spoil Pile #2 would be required.

Let me know which way you decide to go.  
Priscilla.
