RE: Sunnyside Cogeneration Associates
Amendment Regarding Culverts and Road
Sunnyside Refuse and Slurry C/007/035

Dear Mr. Haddock:

Please find attached an electronic copy of SCA's amendment regarding the Sunnyside Refuse and Slurry Mine Site. The amendment includes culvert installation and culvert removal. It also includes updates to roads.

The amendment application includes C1/C2 forms, updated Text, Maps 7-1, 5-2 and 5-2K.

If you have any questions or if further clarification is needed please contact Rusty Netz or myself at (435) 888-4476.

Thank You,

Gerald Hascall
Agent for
Sunnyside Cogeneration Associates

cc. Rusty Netz

APPLICATION FOR COAL PERMIT PROCESSING

Permit Change ☒ New Permit ☐ Renewal ☐ Exploration ☐ Bond Release ☐ Transfer ☐

Permittee: SUNNYSIDE COGENERATION ASSOCIATES
Mine: SUNNYSIDE REFUSE & SLURRY **Permit Number:** C/007/035
Title: UPDATE CULVERTS AND ROADS - REDLINE SUBMITTAL

Description, Include reason for application and timing required to implement:
Site needs have changed and some culverts removed or added and roads updated

Instructions: If you answer yes to any of the first eight questions, this application may require Public Notice publication.

☐ Yes ☒ No 1. Change in the size of the Permit Area? Acres: _____ Disturbed Area: 0.00 ☐ increase ☐ decrease.
☐ Yes ☒ No 2. Is the application submitted as a result of a Division Order? DO# _____
☐ Yes ☒ No 3. Does the application include operations outside a previously identified Cumulative Hydrologic Impact Area?
☐ Yes ☒ No 4. Does the application include operations in hydrologic basins other than as currently approved?
☐ Yes ☒ No 5. Does the application result from cancellation, reduction or increase of insurance or reclamation bond?
☐ Yes ☒ No 6. Does the application require or include public notice publication?
☐ Yes ☒ No 7. Does the application require or include ownership, control, right-of-entry, or compliance information?
☐ Yes ☒ No 8. Is proposed activity within 100 feet of a public road or cemetery or 300 feet of an occupied dwelling?
☐ Yes ☒ No 9. Is the application submitted as a result of a Violation? NOV # _____
☐ Yes ☒ No 10. Is the application submitted as a result of other laws or regulations or policies?
Explain: _____
☐ Yes ☒ No 11. Does the application affect the surface landowner or change the post mining land use?
☐ Yes ☒ No 12. Does the application require or include underground design or mine sequence and timing? (Modification of R2P2)
☐ Yes ☒ No 13. Does the application require or include collection and reporting of any baseline information?
☐ Yes ☒ No 14. Could the application have any effect on wildlife or vegetation outside the current disturbed area?
☐ Yes ☒ No 15. Does the application require or include soil removal, storage or placement?
☐ Yes ☒ No 16. Does the application require or include vegetation monitoring, removal or revegetation activities?
☒ Yes ☐ No 17. Does the application require or include construction, modification, or removal of surface facilities?
☒ Yes ☐ No 18. Does the application require or include water monitoring, sediment or drainage control measures?
☒ Yes ☐ No 19. Does the application require or include certified designs, maps or calculation?
☐ Yes ☒ No 20. Does the application require or include subsidence control or monitoring?
☐ Yes ☒ No 21. Have reclamation costs for bonding been provided?
☐ Yes ☒ No 22. Does the application involve a perennial stream, a stream buffer zone or discharges to a stream?
☐ Yes ☒ No 23. Does the application affect permits issued by other agencies or permits issued to other entities?
☐ Yes ☒ No 24. Does the application include confidential information and is it clearly marked and separated in the plan?

Please attach three (3) review copies of the application. If the mine is on or adjacent to Forest Service land please submit four (4) copies, thank you. (These numbers include a copy for the Price Field Office)

I hereby certify that I am a responsible official of the applicant and that the information contained in this application is true and correct to the best of my information and belief in all respects with the laws of Utah in reference to commitments, undertakings, and obligations, herein.

APPLICATION FOR COAL PERMIT PROCESSING
Detailed Schedule Of Changes to the Mining And Reclamation Plan

Permittee: SUNNYSIDE COGENERATION ASSOCIATES
Mine: SUNNYSIDE REFUSE & SLURRY **Permit Number:** C/007/035
Title: UPDATE CULVERTS AND ROADS - REDLINE SUBMITTAL

Provide a detailed listing of all changes to the Mining and Reclamation Plan, which is required as a result of this proposed permit application. Individually list all maps and drawings that are added, replaced, or removed from the plan. Include changes to the table of contents, section of the plan, or other information as needed to specifically locate, identify and revise the existing Mining and Reclamation Plan. Include page, section and drawing number as part of the description.

Any other specific or special instruction required for insertion of this proposal into the Mining and Reclamation Plan.	**Received by Oil, Gas & Mining**

The sedimentation ponds are described as follows:

Outfall No.	Location	
007	Rail Cut Pond Lat: 39° 32' 14" Long: 110° 23' 48"	Surface runoff discharged from sediment ponds to Icelander Creek.
008	Old Coarse Refuse Pond Lat: 39° 32' 20" Long: 110° 23' 03"	Surface runoff discharged from sediment ponds to SCA Pond 018, then to Icelander Creek.
009	Pasture Pond Lat: 39° 32' 36" Long: 110° 23' 58"	Surface runoff discharged from sediment ponds to SCA Pond 014, then to Icelander Creek.
012	Coarse Refuse Toe Lat: 39° 32' 28" Long: 110° 23' 58"	Surface runoff discharged from sediment ponds to Icelander Creek.
014	Coal Pile Sediment Pond Lat: 39° 32' 38" Long: 110° 23' 32"	Sedimentation Pond to contain runoff from the crushing areas. Discharge to Icelander Creek.
016	Borrow Area Pond Lat: 39° 32' 25" Long: 110° 23' 45"	Sedimentation pond containing runoff from soil borrow area. Discharge to SCA Pond 018 then to Icelander Creek.

The Surface and Groundwater Monitoring Locations shown on Plate 7-2 and listed in Appendix 7-8 on Table 7-2A were monitored for two years (June 1993-1995) according to the Baseline parameters listed in Table 7-2B. This baseline data has been analyzed and incorporated into Appendix 7-4.

The baseline data presented in Appendix 7-4 appears to indicate the following attributes:

- The decreased flows and temperature and the increased pH at the Coarse Refuse Seep Monitoring sites indicate that previously alleged flows through the refuse pile from slurry dewatering in the East Slurry Cell have either ceased or have been substantially reduced to a negligible amount.

- The stiff diagrams for the Coarse Refuse Seep monitoring sites indicate that the CRS, CRC, and CRB have similar water quality characteristics. They are rich in sulfate, magnesium, and calcium. The similarity of the stiff diagrams for the Coarse Refuse Seep monitoring sites deserves comment. Even though a significant increase in flow occurs between the CRS and the CRB, there is not a significant reduction in sulfate, magnesium, calcium or in the level of TDS. It is generally accepted that the increased flows near the boundary are not related to the refuse pile. Therefore, since those increased flows have similar water qualities, it is likely that the earlier increases in flows are also not related to the refuse pile. The inability to find water during the exploratory drilling of the refuse pile in August

PASTURE SEDIMENT POND - Hydrologic Calculations

INTRODUCTION

The Pasture Sediment Pond (UPDES 009) is located north of the West Slurry Cell (see Plate 7-1). The pond is an off channel, temporary sediment control structure, with a total as-built volume of 3.08 acre-feet (top of bank). Surface water runoff and sediment runoff from a 109.25 acre watershed is captured by the pond.

The Pasture Pond has been in service for a number of decades. In 2007, SCA proposed to enlarge this pond and use it to treat runoff from the area formerly served by the Clear Water Pond and Slurry Ponds 1 and 2. These former ponds are now the site of the Excess Spoil Disposal Area #2. The new hydrologic modeling accompanying this appendix section includes the entire combined watershed and the proposed design size of the pond.

The structure is a temporary pond as addressed in R645-301-732.200. The structure does not meet the size or other qualifying criteria of the MSHA of 30 CPR 77.216(a). Therefore, it provides a combination of principal and emergency spillways that will safely discharge a 25 year, 6 hour event.

The pond contains a 2 inch drain pipe. This 2 inch pipe is normally closed but can be opened to discharge the pond after major storm events after appropriate settling times. The pond is modeled in Sedimot-II with the 2 inch drain pipe closed, however, the pond is considered empty above the level of the drain pipe when the storm begins. The maximum sediment level allowed in the pond is therefore set at the elevation of the inlet to the 2-inch drain pipe.

The pond can discharge through an 18 inch culvert when the water level reaches the stage elevation of 6490.6 (6.1 feet deep). The 18 inch pipe spillway is capable of passing the 25 year, 6 hour peak flow. The pond treats the 10 year, 24 hour storm such that effluent is well within the UPDES limits. In 2015, the ditch leaving the discharge point from the Pasture Pond was re-routed to flow into the Coal Pile Sediment Pond (014). This provides a backup treatment option in the event of any discharge from the Pasture Pond.

Culverts and diversion ditches were designed for these watersheds previously under a very conservative storm (100 yr 6 hr). With the combined watersheds now proposed, many of the ditches and culverts will experience a different flow rate for a given storm since upper sub watersheds will now be routed through these lower ditches. Nonetheless, we have compared the previous design flows with the current modeled flows for the 10 year 6 hour storm, 10 year 24 hour storm and 25 year 6 hour storm. We have used the higher of the previous design flow or the current modeled design flow from these storms.

SUBWATERSHEDS

The Pasture Pond drainage area is divided into eighteen sub watersheds for routing analysis. These are labeled in keeping with former naming convention as follows: CW-SWS1, CW-SWS2, CW-SWS3, CW-SWS4, CW-SWS6, CW-SWS7, CW-SWS8, CW-SWS9, CW-SWS10, CW-SWS11, PAST-SWSl, PAST-SWS2, PAST-SWS3, PAST-SWS4, PAST-SWS5, PAST-SWS6, PAST-SWS7, and PAST-SWS8 (see Plate 7-1).

SOIL TYPE

According to the SCS Soil Survey of Carbon Area, Utah, the soil type found in this drainage area is predominantly SCS # 114, Strych. Three soil samples from the adjacent Reclamation Borrow Area were analyzed by Huntingdon/Chen-Northern in the early 1990s. The particle size distribution from these samples was plotted and averaged as shown in Figure One. Other soil characteristics are as follows:

SCS Soil Name	Strych
Submerged Specific Gravity	1.75
Specific Gravity	2.75
Erosion K value	0.20
Bulk Density	1.4

CURVE NUMBERS

The Pasture Pond curve numbers are based on the Soil Conservation Service graph included as Figure Two. The soil types found on the site correspond to SCS hydrologic Class B as indicated in the SCS Soil Survey for Carbon Area, Utah. The vegetation cover is relatively sparse, consisting of a mixture of Juniper-Grass, Mountain Brush, and Desert Brush. Curve numbers were averaged from these vegetation types. When the storage areas are covered with a pile of coarse refuse and refuse fines which have relatively high infiltration rates, these curve numbers will be conservative.

TIME OF CONCENTRATION

Each sub watershed requires a certain time for the water to reach the outlet following the longest path. The runoff from these sub watersheds is approximated by Sedimot-II unit "Disturbed" unit hydrograph for areas with poor vegetative cover. The overland flow velocity was estimated using the Soil Conservation Service Upland Curves (SCS 1972) corresponding to the slope and vegetation of the drainage areas. Time of concentration was calculated by dividing the average velocity into the distance to the sub watershed outlet.

SUB WATERSHED CHARACTERISTICS

Drainage Area	SCS Hydro Class	Vegetation Cover Density	Juniper Grass CN	Mt. Brush CN	Desert Brush CN	**Average Curve Number**	Area acres	Distance to Outlet (ft)	Average Velocity (ft/s)	**Concentration (hrs)**

ROUTING COEFFICIENTS

"Sedimot-II" uses Muskingum routing methods. Flows must be routed between structures or from a subwatershed outlet to the corresponding structure (if the outlet is not at the structure). No routing is used through sub watersheds that do not have inflow from a previous watershed, or structure (this water flow is accounted for with the time of concentration and the unit hydrograph). Areas requiring routing coefficients are indicated in the program output data. Muskingum coefficients K and X are used as follows:

K = Travel time through diversion.

$$X = \frac{0.5^* \text{ Velocity}}{1.7 + \text{Velocity}}$$

RIPRAP SIZING

Riprap is placed along steep channel slopes and at select culvert outlets to control erosion. The size of the stones is based on the expected maximum velocity of water flowing. When peak velocities in the smooth channel are expected to reach 5 ft/s, riprap is required. Figure Three is used to determine the median stone diameter (D_{50}). The riprap mixture should approximate the following gradation:

Stone Size	% Finer
$2*D_{50}$	100
D_{50}	50
$0.5*D_{50}$	20
$0.2*D_{50}$	0

In areas where the increased roughness from riprap does not reduce the velocity below 5 ft/s, a filter blanket (or gravel bedding in a layer $3*D_{50}$) will be used.

STORM RUNOFF VOLUMES AND SEDIMENT VOLUMES

Storm Event	Total Runoff (acft)	Total Sediment (acft)	Pond Stage Elevation	Pond Discharge
10yr 6 hr	**0.56**	0.01 acft	6487.4	0 cfs
10yr 24 hr	**1.93**	0.03 acft	6490.5	0 cfs
25yr 6 hr	**1.27**	0.02 acft	6489.0	0 cfs
100yr 6 hr	**2.65**	0.05 acft	6491.0	4 cfs

The flowline of the primary discharge (decant) pipe is at elevation 6486.6. Sediment levels in the pond are allowed to fill to a maximum of 6485.5 (1.1 ft below the pipe flowline) prior to a required cleaning. The volume of the pond below the sediment fill line is approximately 0.2 acre feet. Ample storage exists to contain the calculated storm runoff volumes and the projected sediment volume from the modeled storms.

The permittee is encouraged to perform the periodic cleaning to elevations lower than the minimum design depth to allow for additional sedimentation storage between cleaning events. Factor of safety values for the berm allow for additional depths for the pond of up to 4 feet as long as these additional depths are at least 12 feet from the interior edge of the berm (3:1 slope from the toe of the berm).

The 100 year 6 hour storm is projected to have a discharge from the pond. Detention time for this storm is modeled to be over 2 hours. This is expected to be adequate to allow settling to occur in the pond adequate to meet the UPDES discharge concentration volumes.

DIVERSION DESIGN

Temporary diversions and culverts for these miscellaneous flows are required to be designed to pass the 10 year, 6 hour storm (R645-301-742.333). They were previously designed for the 100 year 6 hour storm. Combining of the watersheds as proposed in 2006 does not always allow for that same conservative design. However, the designs are still more conservative than the 10 year 6 hour storm. See the table above for design flow rates.

Permanent diversion designs are described in the permit term reclamation plan and final reclamation plan. Design summaries are given in the tables below. The diversions were designed to fit within a range of expected field values. The minimum design channel depth is conservatively calculated by using a minimum channel slope and a maximum expected Mannings N. Additional freeboard is not required in the regulations, but the operator may construct the diversions larger than required to reduce the risk of overflow from storms greater than the required design precipitation event.

The Maximum velocity expected in the channel is calculated by using minimum Manning's N values and maximum channel slopes. Manning's N for a channel bed with riprap is estimated by the equation $N=0.0395*(D_{50})^{1/6}$ with D_{50} in feet (Applied Hydrology and Sedimentology for Disturbed Areas page 188). If the normal depth of flow is less than twice D_{50} then N is estimated by the equation $N=0.456*(D_{50}$ *Slope)0.159 with D_{50} in inches and slope in feet/feet (*Development of Riprap Design Criteria by Riprap Testing in Flumes: Phase 1* May 1987, Colorado State University, prepared for Uranium Recovery Field Office and Division of Waste Management).

While the slopes and N values are expected to be near the middle of the range provided, these values provide the maximum variance accepted without additional rip rap or lining through the channel. The cross sections may vary but must always be sufficient to provide the maximum required flow area.

Culverts were designed for these watersheds previously under a very conservative storm (100 yr 6 hr). With the combined watersheds now proposed, we have checked to make sure that the designs are still more conservative than the required 10 year 6 hour storm. See the table above for the design flow rates used.

The 18" CMP Emergency Spillway is required to be designed to safely pass the 25 year 6 hour storm. It is also required that the discharge be controlled in a manner to reduce erosion and to minimize disturbance to the hydrologic balance. Hydrologic modeling projects that the 25 yr 6 hr storm would not have a discharge from the pond. The 100 year 6 hour storm is projected to have a 3.98 cfs discharge (See tables above for Past D9 / outlet). The spillway and outlet ditch D9 were designed to pass the 100 year storm with velocities less than 5 ft/sec to reduce erosion and minimize disturbance to the hydrologic balance. The outlet ditch flows to ~~an existing surface drainage swale~~the Coal Pile Sediment Pond (014).

~~The proposed 2007 construction of the enlargement to the Pasture Pond is designed to be conducted in accordance with standard practices of construction in Utah. The construction will essentially involve excavation and placement of fill materials for the new containment berm. Standard practices include clearing and grubbing to remove all organic material (including sod, large roots, and frozen soil). No coal related materials will be allowed for use in construction of the pond or the containment berm. Compaction of the fill will occur in lifts of approximately 8" and will be compacted to a minimum of 95% of Modified Proctor tests.~~

Pasture Pond outlet pipe capacity

Inlet Control Culvert Flow

$$\text{Area} = \frac{Q}{C*(2*g*h)^{0.5}}$$

	Solve for Area		Solve for Head		Solve for Flow Rate Q

area=	169.2	in^2	254.5	in^2	254.5	in^2
d=	14.7	in	18	in	18	in

h= head of water above center of pipe

Note:

_The existing Pasture Pond 18" outlet culvert is intended to remain in place even with the pond expansion.

_The hydrologic modeling projects that the 10 year 24 hour design storm will be totally contained without discharge

_The smaller volume of the 25 year 6 hour storm would also be contained with no discharge.

_The 100 year 6 hour storm is projected to have a discharge of approximately 4 cfs.

_The existing 18 inch culvert is calculated to pass 4 cfs with only 0.25 feet of head above the center of the pipe.

_The existing 18 inch culvert is calculated to pass as much as 17 cfs with approximately 4 feet of head in the stand pipe structure

ROUTING COEFFICIENTS

"Sedimot-II" uses Muskingum routing methods. Flows must be routed between structures or from a subwatershed outlet to the corresponding structure (if the outlet is not at the structure). No routing is used through sub watersheds that do not have inflow from a previous watershed, or structure (this water flow is accounted for with the time of concentration and the unit hydrograph). Areas requiring routing coefficients are indicated in the program output data. Muskingum coefficients K and X are used as follows:

K = Travel time through diversion.

$$X = \frac{0.5^* \text{ Velocity}}{1.7 + \text{Velocity}}$$

STORM RUNOFF VOLUMES AND DESIGN FLOWS

Storm Event	Total Runoff (acft)	Total Sediment (tons)	Pond Stage Elevation	D1 cfs	D2 cfs	D3/C1 cfs	D4 cfs	D5 cfs	C2 cfs	C3 cfs	D7 cfs	D8 cfs	D9 cfs	Outlet cfs
10yr 24hr	2.0	680	6212.3	2.9	3.5	0.8	5.2	1.4	5.7	6.0	0.6	6.1	6.7	0.0
25yr 6 hr	1.3	557	6211.2	3.0	4	0.8	5.4	1.6	6.0	6.3	0.7	6.3	7.1	**0.0**
100yr 6hr	2.8	1314	6212.6	**6.3**	**7**	**2.3**	**13.7**	**2.9**	**15.0**	**15.7**	**1.2**	**15.7**	**17.2**	4.8

The flowline of the primary discharge (decant) pipe (and 100% sediment storage) is at elevation 6209.07. Sediment levels in the pond are allowed to fill to 60% of sediment capacity (6207.7) prior to a required cleaning. Adequate storage exists to treat the calculated storm runoff volumes and the projected sediment volume from the modeled storms.

The permittee is encouraged to perform the periodic cleaning to elevations lower than the minimum design depth to allow for additional sedimentation storage between cleaning events.

The 100 year 6 hour storm is projected to have a discharge from the pond. Detention time for this storm is modeled to be over 2 hours. This is expected to be adequate to allow settling to occur in the pond adequate to meet the UPDES discharge concentration volumes.

DIVERSION DESIGN

Temporary diversions and culverts for these miscellaneous flows are required to be designed to pass the 10 year, 6 hour storm (R645-301-742.333). Diversions on a refuse pile are required to be designed for the 100 year 6 hour storm. SCA has provided a design for the 100 yr 6 hr storm on all the ditches in this watershed. Permanent diversion designs are described in the permit term reclamation plan and final reclamation plan.

Design summaries are given in the tables below. The diversions were designed to fit within a range of expected field values. The flow depth and flow area are calculated by using the average channel slope and an assumed channel cross section. Due to the reality that the channel conditions will vary in the field, the critical value is to provide the minimum required cross sectional flow area for the storm flows to pass. Additional freeboard is not required in the regulations, but we have recommended that the operator may construct the diversions larger than required to reduce the risk of overflow from conditions not assumed in this hydrologic model.
