The Willow Creek Mine water monitoring data for the 4th qtr 2007 is ready to upload to the official database.

Several parameters in the samples for sites B151, B3N, B6 and B5 indicate that they are off by more than two standard deviations. These results may be due to the fact that the samples were taken through the ice and some contamination may have occurred. Also, since the samples were taken through the ice I was unable to determine flow.
