Re: West Ridge Mine C/007/041
Permit Change to Include Catchment Structures C and E
Response to Violation #10063

Dear Mr. Haddock:

Enclosed are five copies of an amendment to the West Ridge MRP to include catchment structures C and E in the C canyon drainage below the minesite. This submittal addresses items I and II of the NOV.

If you have any questions or need any additional information, please contact me at (435) 888-4000.

Sincerely,

David W. Hibbs

APPLICATION FOR COAL PERMIT PROCESSING

Permit Change ☒ New Permit ☐ Renewal ☐ Exploration ☐ Bond Release ☐ Transfer ☐

Permittee: West Ridge Resources, Inc
Mine: West Ridge Mine **Permit Number:** C/007/041
Title: Response to NOV #10063 Items I and II , Coal Fines Catchment Structures

Description, Include reason for application and timing required to implement:
Response to NOV #10063

Instructions: If you answer yes to any of the first eight questions, this application may require Public Notice publication.

☐ Yes ☒ No 1. Change in the size of the Permit Area? Acres: _____ Disturbed Area: _____ ☐ increase ☐ decrease.
☐ Yes ☒ No 2. Is the application submitted as a result of a Division Order? DO# _____
☐ Yes ☒ No 3. Does the application include operations outside a previously identified Cumulative Hydrologic Impact Area?
☐ Yes ☒ No 4. Does the application include operations in hydrologic basins other than as currently approved?
☐ Yes ☒ No 5. Does the application result from cancellation, reduction or increase of insurance or reclamation bond?
☐ Yes ☒ No 6. Does the application require or include public notice publication?
☐ Yes ☒ No 7. Does the application require or include ownership, control, right-of-entry, or compliance information?
☐ Yes ☒ No 8. Is proposed activity within 100 feet of a public road or cemetery or 300 feet of an occupied dwelling?
☒ Yes ☐ No 9. Is the application submitted as a result of a Violation? NOV # 10063 Items I and II
☐ Yes ☒ No 10. Is the application submitted as a result of other laws or regulations or policies?
Explain: _____
☐ Yes ☒ No 11. Does the application affect the surface landowner or change the post mining land use?
☐ Yes ☒ No 12. Does the application require or include underground design or mine sequence and timing? (Modification of R2P2)
☐ Yes ☒ No 13. Does the application require or include collection and reporting of any baseline information?
☐ Yes ☒ No 14. Could the application have any effect on wildlife or vegetation outside the current disturbed area?
☐ Yes ☒ No 15. Does the application require or include soil removal, storage or placement?
☐ Yes ☒ No 16. Does the application require or include vegetation monitoring, removal or revegetation activities?
☒ Yes ☐ No 17. Does the application require or include construction, modification, or removal of surface facilities?
☒ Yes ☐ No 18. Does the application require or include water monitoring, sediment or drainage control measures?
☒ Yes ☐ No 19. Does the application require or include certified designs, maps or calculation?
☐ Yes ☒ No 20. Does the application require or include subsidence control or monitoring?
☐ Yes ☒ No 21. Have reclamation costs for bonding been provided?
☒ Yes ☐ No 22. Does the application involve a perennial stream, a stream buffer zone or discharges to a stream?
☐ Yes ☒ No 23. Does the application affect permits issued by other agencies or permits issued to other entities?
☐ Yes ☒ No 24. Does the application include confidential information and is it clearly marked and separated in the plan?

Please attach three (3) review copies of the application. If the mine is on or adjacent to Forest Service land please submit four (4) copies, thank you. (These numbers include a copy for the Price Field Office)

I hereby certify that I am a responsible official of the applicant and that the information contained in this application is true and correct to the best of my information and belief in all respects with the laws of Utah in reference to commitments, undertakings, and obligations, herein.

APPLICATION FOR COAL PERMIT PROCESSING
Detailed Schedule Of Changes to the Mining And Reclamation Plan

Permittee: West Ridge Resources, Inc
Mine: West Ridge Mine **Permit Number:** C/007/041
Title: Response to NOV #10063 Items I and II , Coal Fines Catchment Structures

Provide a detailed listing of all changes to the Mining and Reclamation Plan, which is required as a result of this proposed permit application. Individually list all maps and drawings that are added, replaced, or removed from the plan. Include changes to the table of contents, section of the plan, or other information as needed to specifically locate, identify and revise the existing Mining and Reclamation Plan. Include page, section and drawing number as part of the description.

Attachment 9	Addendum to address Second Violation #10063, Issued July 21, 2010 (Items III and IV)
Attachment 10	Addendum to address Second Violation #10063, Issued July 21, 2010 (Items I and II)

ATTACHMENT 10

ADDENDUM TO ADDRESS SECOND VIOLATION (ITEMS I and II)

VIOLATION #10063 ISSUED JULY 21, 2010

ATTACHMENT 10:
ADDENDUM TO ADDRESS SECOND VIOLATION (ITEMS I and II)
VIOLATION #10063, ISSUED JULY 21, 2010

On July 21, 2010, the company received a second violation for additional accumulations of coal fines in the C Canyon drainage below the West Ridge Mine. The accumulations were the result of non-compliance discharge which occurred after the successful channel cleanup of the previous summer (2009). Representatives from the Division and DWQ inspected the drainage and determined that the coal fines must be cleaned up from the mine down to and including Catchment E.

Attachment 10 addresses the measures that the company will take to ensure that the coal fine accumulations will not be an issue in the future.

I. Visual Inspections
II. Underground Piping System
III. Mine Water Monitoring/Treatment System (Turbidity Analyzer)
IV. Schroeder Industries Filtration System
V. Additional Underground Sampling

I. Visual Inspections:

On July 22nd, the company began visual inspections on the mine-water discharge at Outfall 002. The visual inspections are being recorded every shift by a qualified representative of the company. These records are kept in the shift formans office and will be available for review anytime.

The inspection records will include the representative's name, the date and time of inspection and observations for oil and grease, floating or suspended solids, foam and color. See Exhibit 1.

II. Underground Piping System: (See Map 1)

1. Water Filtration From the Mining Areas:
   - Mains section water at the bottom of the mine is pumped up the right side of the mine to a tank at xc78 (Cyan line) in the right return. From the xc78 tank the water is pumped to a tank at xc67 (Dark brown line) in the right return and relayed to anther tank at xc56. These tanks are designed to settle out solids and are cleaned weekly. From xc56 the water is pumped into the Sealed District 2 gob at 8th Right (Magenta line). The gob acts as a settling area to collect solids from the water. The settled water is then collected from the 9th Right sediment dam.

- West side water is pumped from sump to sump beginning at Sump 18 in 14th West, the water is then pumped to Sump16 in 13th West then from
  i. Sump 16 in 13th West to Sump 15 in 12th West (Blue line) then from
  ii. Sump 15 in 12th West to Sump 14 in 11th West (Light brown line) to
  iii. Sump 14 in 11th West to Sump 13 in 10th West (Light Dark Green line) to
  iv. Sump 13 in 10th West to Sump 12 in 9th West (Light purple line) to
  v. Sump 12 in 9th West to 8th Right Seal into the Sealed District 1 gob (Light brown line)

  The gob acts as a settling area to collect solids from the water. The settled water is then collected from the 9th Right sediment dam.

2. Treated Water Pumped to 4th Right:
   - The water is pumped out of 9th Right through the treatment area, where it is treated for iron and TSS through aeration and chemical injection. From the treatment area the mine-water is pumped into the Sealed District 1 gob at 4th Right (Blue line). The gob acts as a settling area to collect solids from the water. The settled water is then collected from the 5th Right sediment dam.
   - Mine-water from 8th West to 6th West that comes out of the seals has already settled in each of the gobs. The water is thus pumped directly into the Sealed District 1 gob at 4th Right (Magenta lines). The gob acts as a settling area to collect solids from the water. The settled water is then collected from the 5th Right sediment dam.

3. Water Run to the Surface:
   - From the 5th Right collection point there are three separate lines that run to the surface (Lime green, dark red, and brown lines).

4. Water Filtration and Discharge:
   - At the surface all the discharging pipes will join and run through the Schroeder Industries BH10 Multi-Bag Filters before being discharged into the stream.

III. Mine Water Monitoring/Treatment System (Turbidity Analyzer):

West Ridge has chosen the HACH Solitax sc sensor that will be capable of monitoring both turbidity and total suspended solids (TSS) from the 5th Right sump area. Fifth Right is the collection area for the majority of the water pumped from the West Ridge Mine. The Solitax sensor measures using a combined infrared absorption scattered light technique that measures turbidity values in accordance with DIN EN 27027. An additional sensor photo receptor is used to measure suspended solids. The mine is proposing sensors for both turbidity and TSS; these sensors will be installed in the suction line of the pumps in 5th Right sump that connects to all discharge lines. This arrangement will allow for monitoring of all discharge water from the mine.

The Sensors will be installed and maintained according to the manufactures recommendations. The sensor will be installed fully immersed in a horizontal up-flow pipe section on the suction line of the pumps. The controller will be installed within 7.8M of the sensors.

The Calibration for turbidity will be done using the 800 NTU Turbidity Standard Solutions and Calibration Kit (at. No. 57330-00) standard. Also a zero-point calibration will be done using deionized water. The 800 NTU standard will be divided by the measured value to determine the new Factor to be entered into the sc-100 controller. Calibration for turbidity will be done on a monthly basis. If the sensor is drifting in calibration, calibrating will be done more frequently.

Calibration for TSS will be done using a single point calibration using actual samples. A grab sample will be taken monthly and sent out to a water lab to determine the TSS value. The lab value will then be divided by the measured value resulting in a new Factor. This new Factor will then be entered into the sc-100 controller. Calibration for TSS will be done on a monthly basis. If the sensor is drifting in calibration, calibrating will be done more frequently.

Digital data from the sensors will be sent to the sc-100 controller and to the conspec system simultaneously where it will be analyzed and stored. The Continuous Mine Monitoring System ("Conspec") is monitored on the surface by an attendant at all times.

An audio and visual alarm will be initiated at the conspec terminal when the TSS limit exceeds 35 mg/l. This alarm will be considered the low level alarm. The conspec operator will immediately notify the responsible person (person in charge) who will, as soon as practical, investigate the low level alarm and take appropriate action.

Should the TSS level reach 70 mg/l or above, a high level alarm will be initiated using both audio and visual means. The conspec operator will immediately notify the responsible person who will take appropriate actions which could include turning the pumps off. By turning off the pumps all mine water discharge will cease.

During times of maintenance or breakdown, when and if both sensors go off line, visual monitoring will be initiated at mine-water Outfall discharge 002. Visual observations will be taken at least twice a shift and recorded in a logbook. The observer will note any changes in flow, amount of foam, suspended solids, color or general condition of the outflow. If any obvious visual changes are observed all mine water discharge will cease and the system evaluated.

A hardbound logbook will be maintained at the mine that includes the dates, times, and personnel who performed maintenance and calibration on the mine-water monitoring/treatment system and will be available for inspection upon request.

The SOLITAX sc Suspended Solids and Turbidity Analyzer is on order and is expected to arrive in 30 days with 10 days for installation and setup.

IV. Schroeder Industries Filtration System:

On July 30, 2010, West Ridge Resources ordered the Schroeder Industries BH10 Multi-Bag Filtration System. The BH10 is estimated to arrive in 4 to 6 weeks. This system will be installed on the surface near the main ventilation fan (See Map 1). It should be noted that after the installation of the Filtration System, the company will try different micron sized bags to see what filters will work best for this application. The BH10 filters will then be used to ensure discharge water meets effluent limitations outlined in the UPDES Permit.

All mine-water discharge pipes will join together at the surface before being filtered. All mine-water will then be routed to the Schroeder BH10 Filtration System (Exhibit 3). This system is designed to filter up to 2000 gpm of discharge water. A bypass pipe will be installed to provide for filter changes and cleaning. Filters will be changed out on a regular basis.

V. Additional Underground Sampling:

A monthly sample of the in-mine water will be collected prior to treatment and analyzed for operational field and laboratory parameters. Parameters will include total and dissolved iron, sulfate, alkalinity, total and dissolved solids, field conductivity, field temperature, field dissolved oxygen and field pH. The sample will be collected in 9th right between the seal and treatment area. This sample point will be called UG-1. See Map 1 for location.

CHAPTER 7…REPLACEMENT PAGES

Wells

Only one groundwater monitoring well (DH86-2) exists in the permit area. This well monitors the Sunnyside Sandstone Member of the Blackhawk Formation, which is below the coal seam that will be mined. In addition to field parameters and operational water quality parameters, water level will be measured in this well.

Underground Sampling

UG-1 Starting in the fall of 2010, West Ridge Resources will begin an underground monitoring program on the pre-treatment mine-water. A monthly sample of the in-mine water will be collected prior to treatment and analyzed for operational field and laboratory parameters. Parameters will include total and dissolved iron, sulfate, alkalinity, total and dissolved solids, field conductivity, field temperature, field dissolved oxygen and field pH. The sample will be collected in 9th right between the seal and treatment area. This sample point will be called UG-1. Please refer to Appendix 5-15, Attachment 10 for a description and location of UG-1.

Note 1: ST-4 was discontinued in the third quarter of 2005 and replaced with ST-13.

Note 2: ST-11 will be monitored monthly from May 15 through September 15 as long as flow is present during the flow season of 2005 and 2006 and quarterly throughout the remainder of the year. Thereafter, monitoring will be done on a quarterly basis.

Note 3: ST-12 will be monitored twice a year (late spring/early summer and late summer/early fall) during 2005 and 2006. Based on the results of this monitoring, the plan will be reassessed to determine if this site should be included in the permanent monitoring plan.

Note 4: ST-15 will be monitored for baseline data for the first two years (starting third quarter 2005) according to the surface water monitoring parameters outlined in Table 7-2.

Note 5: SP-101 and SP-102 will be monitored for baseline data for the first two years (starting third quarter 2005) according to the ground water monitoring parameters outlined in Table 7-3.
