COMMITMENTS AND CONDITIONS

The Permittee is responsible for ensuring annual technical commitments in the Mining and Reclamation Plan and conditions accepted with the permit are completed throughout the year. The Division has identified these commitments below and has provided space for you to report what you have done during the past year for each commitment. If additional written response is required, it should be filed as an attachment to this report.

Title: EXPERIMENTAL FIELD TRIALS
Objective: Monitoring to support proposed experimental practice. Provide a comparison of growth on field trials with Douglas/Fir reference area.
Frequency: Annual evaluation in June
Status: Ongoing
Reports: Provide in annual report
Citation: MRP, Volume 1, Appendix 2-6 and Volume A, Map 2-4

Operator Comments

The required report, "Vegetation Monitoring at the Experimental Test Plot, 2011", prepared by Mt Nebo Scientific, is included.

Reviewer Comments ☐ Met Requirements ☐ Did Not Meet Requirements

Title: SOIL SAMPLING OF FILL AT T1, T2 AND T3
Objective: To protect buried substitute topsoil in the fill. Collect a composite sample from several locations near each site to obtain a more average value.
Frequency: Annual evaluation during field season.
Status: Ongoing beginning in 2010.
Reports: Annual report
Citation: MRP, Volume 1, Appendix 2-6 addendum and Volume A, Map 2-4

Operator Comments

The required report, "Soil Monitoring at the West Ridge Mine, 2011", prepared by Mt. Nebo Scientific, is included.

Reviewer Comments ☐ Met Requirements ☐ Did Not Meet Requirements

Title: SUBSIDENCE MONITORING

Objective: To monitor subsidence from longwall mining practices. Subsidence monitoring of panels until the effects of mining have stabilized and vertical movement is less than six inches per year.

Frequency: annual

Status: Ongoing

Reports: annual report

Citation: MRP, Volume 2, Chapter 5, page 5-23b to 5-23e

Operator Comments

Subsidence information is included.

FUTURE COMMITMENTS AND CONDITIONS

The following commitments are not required for the current annual report year, but will be required by the permittee in the future as indicated by the "status" field. These commitments are included for information only, and do not currently require action. If you feel that the commitment is no longer relevant or needs to be revised, please contact the Division.

Title: RECLAMATION MONITORING
Objective: Visually assess the revegetation success.
Frequency: Quarterly for the first three years and annually in June of each year thereafter
Status: Implement at reclamation
Reports: Annual Report
Citation: MRP, Volume 1, Chapter 3, page 3-16, paragraph 2

Title: MEXICAN SPOTTED OWL SURVEY
Objective: Conduct appropriate surveys for Mexican spotted owls on the lease tract areas with 40 percent or greater slopes, cliff habitat areas, riparian habitats, and mixed conifer forest habitats, prior to any future surface disturbing activity and/or any mining activity with the potential to interrupt surface spring flows. Inventory work must be conducted by parties approved and permitted for such survey work by the Fish and Wildlife Service and qualified in accordance with R645-301-132. Surveys must follow current protocol established by Fish and wildlife Service.
Frequency: As needed
Status: ongoing
Reports: Annual
Citation: Permit condition attachment A, special condition #3.

Title: SOIL SAMPLING OF FINAL GRADED FILL AT CATCHMENTS A, C AND E
Objective: To evaluate salinity
Frequency: Once after final grading
Status: Future commitment
Reports: Provide information to the Division
Citation: MRP, Volume 2, Appendix 5-15, Attachment 9, page 14

INTRODUCTION

As described in previous monitoring reports for the West Ridge Mine, an "experimental practice" for the protection of soil resources was designed and implemented at the site. The experimental practice was designed to test the effectiveness of burying soils in-place rather than salvaging (removing) them and returning them at the time of final reclamation. The in-situ topsoil was covered with a geotextile material and layer markers followed by fill material to create working areas for surface operations of the mine.

As a method to monitor the buried soil resources, West Ridge Resources committed to sampling mine pad areas in specific locations to determine whether or not they are being affected by coal and surface operations. In the document called *West Ridge Mine Experimental Practice Annual Evaluation 2000: Addendum to Appendix 2-6*, page 4, it stated that a monitoring program, starting in the year 2000, will be implemented to sample and determine if the mine pad areas affected by the coal are being "acidified". The same document states that the samples will be analyzed for acid/toxic-forming potential per Division Guidelines. In consulting with soils specialist, Priscilla Burton, from the State of Utah, Division of Oil, Gas & Mining (Division) prior to sampling in 2001, it was determined that the most appropriate parameters to be analyzed on the mine pad areas were: pH, electrical conductivity (EC), sodium adsorption ratio (SAR) and calcium carbonate ($CaCO_3$). Moreover, it was determined that sampling should be done at the depth of 6-12 inches as

opposed to 3 inches as stated in the addendum cited above.

METHODS

Soil samples of the mine **pad areas** were taken by Patrick Collins (*Mt. Nebo Scientific, Inc.*) at the West Ridge Mine site in specified locations on September 11, 2001 (that haunting day), November 25, 2008, July 2, 2009, July 22, 2010 and September 1, 2011. The *approximate* (see below) same locations were sampled all years and are shown in Figure 1. Below are brief descriptions of these locations:

T1 *Located in the right fork, it was originally described to be 64 ft northwest of the jersey barrier in the center of the canyon. Because this location was so close to construction and where equipment was placed at the time, the sample was taken about 25 ft north of that location in 2008 and 2009. In 2010 there was a new building at the previous sample area, so the soil sample pit was re-located very closeby, but 10 ft west of the northwest corner of the new building (2010 GPS name and UTM coordinates: WR T1, NAD 27, 12 S 548475 E, 4385176 N). In 2011, the sample was taken in the same place as 2010.*

T2 *Located in the left fork in the coal storage area, the sample was taken at the base of the dike in the center of the canyon. In 2009, coal covered the previous sample pit location so the sample was taken at the outside base of the dike that encloses the coal storage area. In 2010, the coal pile had been removed from the original sample location, so the soil sample was taken once again at the toe of the inside dike (2010 GPS name and UTM coordinates: WR T2, NAD 27,12 S 548098 E, 4385201 N). In 2011, the coal had again been placed in the 2010 sample location. So, the sample was taken on the inside berm where the pure coal pile ended; nonetheless some coal was mixed with the soil sample because the coal level had been at that elevation previously (new UTM coordinates: WRT2, NAD 27, 12S 548089 E, 4385214 N).*

T3 *Located in the load-out area, the sample was taken 54 ft uphill from the conveyor belt footing on the north side of the ditch. In 2010, because of the equipment stored in the area, the pit location was slightly different from 2009, or 60 ft from the concrete conveyor belt footing on the north side of the drainage ditch in the area (2010 GPS name and UTM coordinates: WR T3, NAD 27,12 S 548175 E, 4384956 N). In 2011, the sample was taken in the same place as 2010.*

Soil sampling in the **Experimental Test Plots** was also conducted by Gary Gray, *P.E. (West Ridge Resources)* in the fall of 2005 (more information about that is given later in the report).

Soil sample pits were hand-dug with a pick and shovel. A composite sample was taken at depths between 6 and 12 inches at each of the locations described above. Small amounts or soil material were taken at each depth and mixed in the field. Soils were analyzed by the Brigham Young University, Soil and Plant Analysis Laboratory, Provo, Utah. Parameters and laboratory methods used are shown below.

pH	*ASA Mono. No. 9, Part 2, (2 ed), 1982. Method 10-3.2, page 171. Perform pH on saturated paste.*
ECe	*Electrical conductivity reported as mmhos/cm 25°C. ASA Mono. No. 9, Part 2, (2 ed), 1982. Method 10-3.3, page 172-173.*
SAR	*Sodium Adsorption Ratio. Calculated from soluble Ca, Mg and Na.*

RESULTS

The laboratory results for 2001, 2008, 2009, 2010 and 2011 for the soils in the pad areas are shown on Table 1. The entire 2011 lab report has been included in the Appendix of this report; original lab reports for the other years were included in the respective sample reports for those years.

The only values that exceeded acceptable levels according to DOGM soil guidelines were from 2008 samples; the parameters that exceeded the standards were EC and SAR in sample T3. The high concentration of salts (EC and SAR) may likely be the result of road salt that is placed in the travel areas at the mine to treat snow and ice. The road salts can also accumulate in the snow and on the coal trucks while using the haul road to and from the mine. This snow and salt most-likely drops off the trucks while idling at the loadout site. By 2009, however, the salts appear to have leached below the sampling depths. In 2010, the SAR in T3 was high again and would be considered "poor" by Division standards, but again was not in the "unacceptable" range. The mean values for the sample years rendered all parameter values within the acceptable limits according to Division Guidelines. Additionally, "acidification" of the soils will probably not be a problem due to the neutralizing or "buffering" effect caused by the high percentage of calcium carbonates (% $CaCO_3$) present in all samples. By 2011, the values for nearly all parameters were in the "good" range by Division standards (the one exception was the pH value in T1 where 8.4 put it in the "fair" range. All means for each parameter were in the "good" range.

As a means for comparison, Table 2 shows results of soil sampling in the **Experimental Test Plots** at the West Ridge Mine in 2005. These plots were created to simulate final reclamation of those soils that were left in-place, covered by a geotextile layer, marked with strips, then covered with fill material for the life of the mine. At the time of final reclamation the geotextile fabric, markers and fill will be removed thus exposing the native soils enabling revegetation to proceed. A similar process to test this reclamation design was implemented in the Experimental Test Plot area by placing material over existing soils, then later removing it, followed by revegetation techniques.

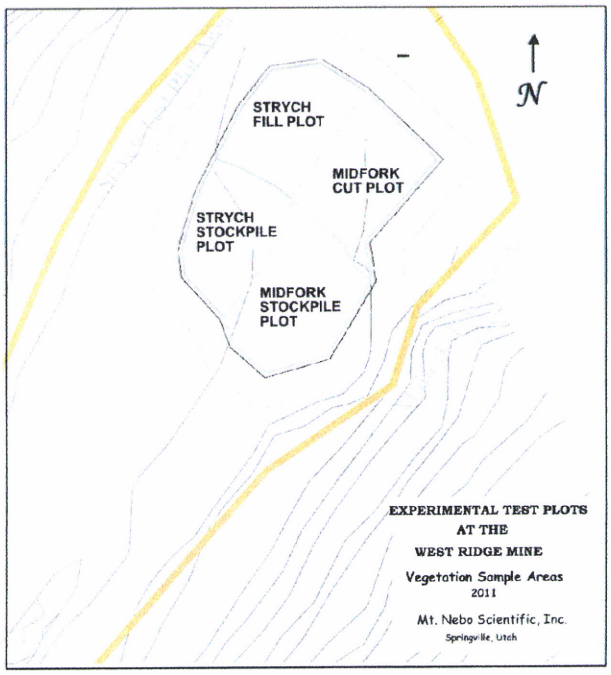
LABORATORY ANALYSES. . . . . Appendix

INTRODUCTION

As described in the West Ridge Mine, Mining & Reclamation Plan, experimental Practice Test Plots were constructed at the site in1999 (see the Plot Layout below). These plots were created to simulate final reclamation of those soils that have been left in-place (as opposed to the more common practice to remove and stockpile them). They were covered by a geotextile layer (as a means for preservation of the in-place topsoil), identified with marker strips (to facilitate locating them at the time of reclamation), then covered with fill (to simulate the material used to cover the mine pad areas during operations), then covered with other topsoil material, and finally seeded with the *interim* seed mixture for erosion control.



Plot Layout

In 2005, or six years following the initial test plot construction, the above procedures were reversed in an attempt to imitate final reclamation and revegetation of the mine site. Or, the fill and topsoil were removed until the marker strips were exposed. These materials were then returned to their place of origin. The geotextile material was then removed exposing the topsoil and subsoil that was left "in-place", followed by re-seeding the area with the seed mixture formulated for *final* revegetation.

In a letter to West Ridge Resources (Burton 2009)[1], the following additional

comments regarding the history of the Experimental Test Plots were stated:

- The work began with removing stinging nettle seed heads from a patch of nettle that completely covered the Midfork Stockpile Area.
- Certified noxious weed-free alfalfa hay was gouged into the regraded site (copy of certification was attached to the Inspection Report #717).
- There was no application of straw and wood fiber mulch tackifier.
- There was no soil amendment added based upon visual observation of vegetative cover, but soil samples were taken to document the soil chemistry.
- Soils were sampled from the test plots after they were regraded. The Brigham Young University Soil and Plant Analysis Lab analysis is dated October 4, 2005. ***(NOTE**: The 2005 laboratory report has been provided in the appendix of this report)*.
- The seeding was done on October 31, 2005.
- According to information received by the Division on September 10, 2005, the seed mix outlined in Table 3-2B (*in MRP, Appendix 2-6*) was modified due to availability: Sandberg bluegrass replaced muttongrass (*Poa fendleriana*) and neither canyon sweetvetch nor rocky mountain maple were commercially available and were not included in the seed mix.
- Containerized plants shown on Table 3-2B (*in MRP, Appendix 2-6*) were not available and not planted.
- A vegetative analysis was conducted in August 2008 and results are presented in an addendum to Appendix 2-6 (*in MRP*) .
- Burton (2009) speculates that the predominance of stinging nettle in the Midfork Cut plot may have resulted from the Midfork Stockpile area (the source of the Midfork Cut topsoil) that was covered with stinging nettle and the root propagules and seed were more than likely carried over with the soil.
- The Strych Stockpile Area is the only plot that represents the experimental practice of burial and storage in place. A comparison of the Strych Stockpile area and the Strych Fill area is the test of the conventional technique versus the experimental technique in the same soil type.

This document was prepared to report the current (2010) status and condition of specific parameters for the vegetation of the Experimental Test Plots at the West Ridge Mine.

METHODS

Methodologies used for this study were performed in accordance with the guidelines supplied by the State of Utah, Division of Oil, Gas and Mining (DOGM). Quantitative and qualitative data were recorded September 1, 2011. The reference area proposed to ultimately be compared with this plot for revegetation success standards, was sampled during the growing season of 1998. These data were also presented herein for general comparisons with the results of quantitative sampling conducted in 2011 on the test plots.

Sampling Design and Transect/Quadrat Placement

Transect lines for vegetation sampling were placed randomly within the boundaries of the test plots. The transect placement technique was employed with the goal to adequately sample a representative subset of the plot. Once the transects were established, quadrat locations for sampling were chosen using random numbers from the transect lines with the objective to record data without preconceived bias.

Cover and Composition

Cover estimates were made using ocular methods with meter square quadrats. Species composition, cover by species, and relative frequencies were also assessed from the quadrats. Plant nomenclature follows "A Utah Flora" (Welsh et al., 2008).

Woody Species Density

Density of woody plant species was not assessed because very few or no trees or shrubs were present on the plots.

Photographs

Color photographs of the sample areas were taken at the time of sampling and have been submitted with this report.

Raw Data

The raw data have been summarized on a spreadsheet and is available upon request by the operator or DOGM.

RESULTS

Midfork Cut

The Midfork Cut plot (Photo1) was largely dominated by stinging nettle *(Urtica dioica)* and western wheatgrass (*Elymus smithii*). Other dominant plant species were bluebunch wheatgrass (*E. spicatus*) and thickspike wheatgrass *(E. lanceolatus)*. For a list of all plant species by cover and frequency found in the test plot, refer to Table 1.

Total living cover of the plot was estimated at 83.00% (Table 2-A). The living cover was comprised of 52.21% forbs (mostly due to the stinging nettle), 47.79% grasses with no shrubs present in the sample quadrats (Table 2-B).

Midfork Stockpile

The dominant plant species represented in this plot (Photo 2) were western wheatgrass, Lewis flax (*Linum lewisii*), thickspike wheatgrass, and bluebunch wheatgrass (Table 3).

Douglas Fir/Maple Reference Area

The existing Douglas Fir/Maple Reference Area (Photo 5) was chosen to ultimately be compared to the test plots. Although this is an early comparison considering the length of time the test plot has been "reclaimed" (re-worked), data from quantitative sampling of this reference area in 1998 have been presented in this report. Moreover, when the final revegetation is compared to the reference area, the sampling will be accomplished during the same growing season.

Understory in the Douglas Fir/Maple Reference Area was dominated by bigtooth maple (*Acer grandidentatum*), mountain lover (*Pachistima myrsinites*), and Oregon grape (*Mahonia repens*). Overstory dominants were bigtooth maple and Douglas fir (*Pseudotsuga menziesii*). A list of all species present in the sample quadrats for the reference area is shown in Table 9.

The total living cover of the reference area was estimated at 63.63% of which overstory and understory cover was nearly equally represented at 31.38% and 32.25%, respectively (Table 10-A). Woody species comprised 61.57% of the total living understory cover, followed by forbs at 25.33% and grasses at 13.10% (Table 10-B).

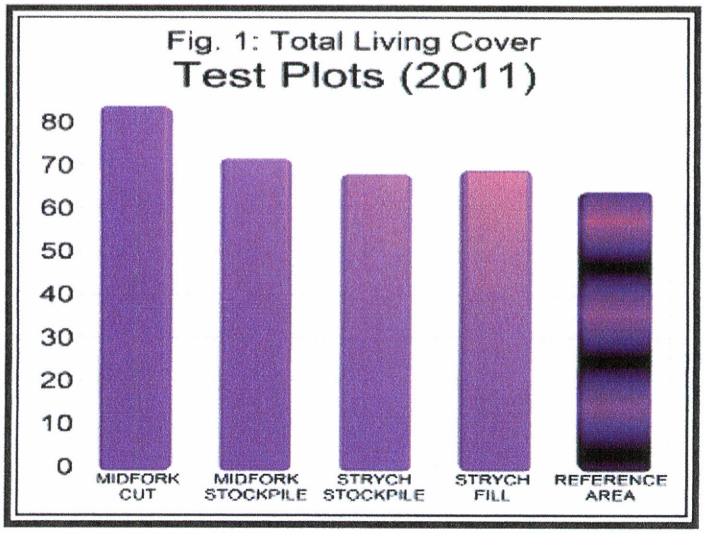
DISCUSSION

Similar to the 2008, 2009 and 2010 sample years, in 2011 there was a prevalence of stinging nettle in the Midfork Cut area of the Experimental Test Plots. Stinging nettle was also an important species in the Strych Fill plot in all years, but not as prevalent as the Midfork Cut plot. Although not necessarily and undesirable species, it is interesting to note where the plant was a dominant species. Comments about this have been provided by (Burton 2009)[1] described in the INTRODUCTION of this document.

A graphic representation of the *total living cover* can be observed on Fig 1. As can be noted from the figure and also the data summary tables in this report, (as well as previous years' monitoring reports) there was not a great deal of difference between the total living cover in the plots that represented soils that remained *in-place* to those that represented soils of the more typical scenario of first *stockpiling* the topsoil and then returning it at the time of revegetation. For some reason, the Midfork Cut plot had more cover in 2011 than in 2010, but it had a value closer to this in earlier years. Moreover, most of the total living cover values for the test plots were similar to that of the Reference Area, with the possible exception of the Midfork Cut plot where the cover was higher in 2011.



For lifeform composition, the most obvious observation was that there were very few woody species present in the test plots, especially when the Reference Area is compared (Fig. 2). This is most likely because the *interim* seed mixture was used on the plots, not the *final* mixture. Interim seed mixtures generally have very few woody plant species included in them.

- Mined Area

NOTE:
Mine projections are subject to change depending on conditions encountered in the underground mine workings.
Actual mine works are shown as of July 5, 2011.
Mine projections depicted in the fringe areas beyond the existing permit area are speculative and based on future reserve acquisitions.
No mining will be conducted in these areas unless those reserves are acquired in the future and permitted according to federal, state, and local permitting requirements.
West Ridge Resources acknowledges that permission to mine within the permit boundary does not imply permission to mine beyond the permit boundary.
