RE: Reconstruction Plan for Emery Revegetation Demonstration Site, Consolidation Coal Co., Emery Deep Mine, ACT/015/015, Emery County, Utah

The above mentioned plan submitted June 30, 1987 has been reviewed against previous deficiencies, as outlined in the March 11, 1987 review. The operator has adequately addressed the Soil analysis and irrigation management plan concerns.

The soil analysis indicates that a salinity problem may develop on the test plot soils. Therefore to reduce the potential of a saline horizon developing, the irrigation scheme will consist of applying two inches of water every two weeks instead of the previous proposed plan of one inch every week.
