Division of Oil, Gas and Mining
1594 West North Temple, Suite 121 0
Box 145801
Salt Lake City, Utah 84114-5801

Re: Submittal of Annual and Subsidence Reports for 2012, PacifiCorp, Trail Mountain Mine, C/015/009, Cottonwood Mine, C/015/019, Deer Creek Mine, C/015/018, Des-Bee-Dove, C/015/017, Emery County, Utah.

PacifiCorp, by and through its wholly-owned subsidiary, Energy West Mining Company as mine operator, herewith submits the Annual, Hydrology, and Subsidence Reports for 2012.

Two hard copies of the reports are included with this submittal. Additionally, the Raptor Survey Report is also included and attached as "CONFIDENTIAL".

If there are any questions or concerns please call Dennis Oakley at 687-4825.

Sincerely,

Kenneth S. Fleck

TABLE OF CONTENTS

INTRODUCTION

Brief History

The Des-Bee-Dove Mine site is an area with a rich coal mining history. State of Utah on-line information provides a brief history of the Des-Dee-Dove Mine site. Their description follows below:

> *The Des-Bee-Dove Mine complex (the Deseret, Beehive and Little Dove Mines) was acquired by Utah Power and Light in 1972 from Deseret Coal Company, an LDS Church enterprise. Two coal seams, the Hiawatha and Blind Canyon, were mined using the room and pillar method. The LDS Church and the Castle Valley Fuel Company mined the property from 1938 to 1947. Prior to this, from 1936 to 1938, the mine workings were operated by two men, Edward and Broderick. Mining first occurred in the canyon in 1898 when the Griffith Mine was started.*
>
> *The Des-Bee-Dove mines were operated by Utah Power and Light Company until 1989 when the merging between PacifiCorp and UP&L took place. In 1990, Energy West Mining Company, a wholly owned subsidiary of PacifiCorp replaced the UP&L Mining Division as operator of its mines: Cottonwood/Wilberg, Deer Creek, Des-Bee-Dove, and Trail Mountain. The Des-Bee-Dove Mine permit area encompassed over 2,800 acres, a combination of fee land, and state and federal leases. Leases have been relinquished and the permit area has been reduced to 154 acres. The mine complex has been in temporary cessation since 1987 and was reclaimed in 2003.*

Purpose of Study

After the coal mining was terminated at the site, *Energy West Mining Company* began reclamation and revegetation activities. By 2003 this work was completed. In 2004, or Year 1 following reclamation, the seeded plant species began to germinate and grow. Since that time, the restored plant communities have been monitored to document the progress in the reclaimed areas. Earlier documents submitted to the regulatory agencies reported updates on the revegetation process from sampling the area in 2005 (Year 2) and 2007 (Year 4).

Reclaimed mine sites are required to provide enough time for acceptable plant establishment before applications can be made for bond release. This time-frame, called the *Responsibility Period*, prescribes at least 10 years before the mine operator can submit a request for *Final* or

Phase III Bond Release through the state of Utah. It has been estimated that this period of time is long enough to determine whether or not adequate re-establishment of a given reclaimed plant community has occurred on sites at this precipitation zone in the western United States. The vegetation of the reclaimed lands must meet specific state and federal requirements. Consequently, at the beginning of Year 9 of the 10-year period, intensive sampling can be initiated for two consecutive years to determine whether or not the reclaimed site has met pre-determined revegetation success standards.

The purpose of this document is to compare reclaimed areas of the mine site with specific success standards (more information about these standards are provided later in this report). The content of this report provides **Year One** results of the two consecutive years of sampling required prior to submittal of an application for bond release by the mine owner through the State of Utah, Division of Oil, Gas & Mining (DOGM).

Site Description

The Des-Bee-Dove Mine site is located approximately 10 miles northwest of the town of Castle Dale, Utah. Elevation of the study sites ranged between 7,200 ft and 8,000 ft above sea level. Slopes of the study area were variable, but were often relatively steep and had various aspects.

Prior to disturbance by mining, the native vegetation was most likely dominated by pinyon-pine (*Pinus edulis*) and Utah juniper (*Juniperus osterosperma*), with Salina wildrye (*Elymus salinus*) as the most common understory species.

METHODS

Quadrat Placement

Sample quadrats for quantitative sampling the vegetation were randomly placed throughout the reclaimed areas in an attempt to adequately represent each site as a whole. This was accomplished by randomly placing several transect lines through the entire lengths of each study area. Random numbers were then generated and used to measure distances at right angles from the line to determine sample locations. Whether these random numbers were odd or even determined which side of the transect line a given quadrat was placed. The random numbers selected were high enough to place quadrats to the lateral limits of each sample area and all areas in-between.

Cover, Frequency & Composition

Cover estimates were made using ocular methods with meter square quadrats. Species composition and relative frequencies were also assessed from the quadrats. Plant nomenclature follows *A Utah Flora* (Welsh et al. 2008).

Diversity Indices

Two diversity indices have been employed to measure the reclaimed and reference areas. *MacArthur's Diversity Index* is an effective diversity measurement and is computed using the following equation:

$$1/\sum pi^2$$

where,

pi is the proportion of sum frequency contributed by the *i*th species in the sample area of concern.

The proportional contribution of each species is then squared and the values for all species in the sample areas are summed. This index integrates the number of species and the degree to which frequency of occurrence was equitably distributed among those species.

Another diversity measurement was provided that presents the *Average Number of Species* encountered at each quadrat.

Sample Size & Adequacy

Sampling adequacy was calculated using the formula given below.

$$nMIN = \frac{t^2 s^2}{(dx)^2}$$

where,

nMIN	= minimum adequate sample
t	= appropriate confidence t-value
s	= standard deviation
x	= sample mean
d	= desired change from mean

Confidence levels were calculated and reported at 80% (t) and 90% (t) with the desired change from the mean (d) placed at 0.10. Sample sizes were, however, also based on the size of each study area, resulting in more samples taken in larger areas.

Vegetation Sample Area Map

The locations of the general base map was prepared by *Energy West Mining Company*. A Vegetation Sample Area Map using this base map has been included in this report.

Photographs

Several electronic color photographs were taken of the sample areas and will be kept on file at *Mt. Nebo Scientific, Inc.* A number of representative photographs for each study site has been included in this report.

RESULTS

Sample Areas

The reclaimed Des-Bee-Dove Mine was subdivided into separate study areas. The areas were sampled and reported independently to allow closer scrutiny of individual sites. These areas, along with the sample size for each parameter, are shown on Table 1. The sample areas are also shown on the vegetation sample area map and color photographs provided later in this report.

Table 1: Sample areas, acreage and sample sizes of the reclaimed Des-Bee-Dove Mine site (2012).

Sample Area	Acres	Cover (n)	Density (n)	Production (n)
Access Trail	3.5	40	40	40
East Slope	5.0	100	100	50
Bathhouse Slope	7.6	150	150	75
Deseret Mine	2.7	50	50	25
Switchbacks	1.1	20	20	10
Substation	0.4	10	10	5
Beehive/Little Dove Mine	2.1	40	40	20
Pinyon-Juniper Reference Area	1.0	40	40	40
TOTALS	**23.4**	**450**	**450**	**265**

Separated Datasets

Results of quantitatively sampling the reclaimed areas at the Des-Bee-Dove Mine site have been provided in summary tables of this report. The total acreage of the reclaimed area is relatively large, so it has been divided or *separated* into smaller sites to first enable a data review on an area-by-area basis. This design enables the reviewer to observe the successes (or failures) of individual reclaimed areas of the restored vegetation. Datasets have also been *lumped* to make statistical comparisons with the revegetation success standards for Phase III Bond Release (more on that later).

A summary of the results of sampling each reclaimed area as well as the reference area is provided in this section of the report. To facilitate access to the cover, composition and density data for each sample area in this report refer to Table 2. The *separated* data summaries are shown on Table 3 *through* Table 34. A list of the common plant names found in the summary tables is shown on Table 38.

Table 2: Data Locator for the Des-Bee-Dove Mine (2012).

Access Trail

The reclaimed Access Trail area was dominated by fourwing saltbush (*Atriplex canescens*) by quite a large margin, but also important in the sample quadrats were: shadscale (*A. confertifolia*), bluebunch wheatgrass (*Elymus spicatus)*, thickspike wheatgrass (*E. lanceolatus*) and western wheatgrass (*E. smithii)*. For a list of all species encountered in the quadrats, refer to Table 3. The total living cover in this area was estimated at 48.88% (Table 4-A). The living cover's lifeform composition consisted of 56.67% shrubs, 36.16% grasses and 7.16% forbs (Table 4-B). Woody species density measurements totaled 4,057 individuals per acre (Table 5); the dominant shrubs here were fourwing saltbush, shadscale and rubber rabbitbrush (*Chrysothamnus nauseosus*). Finally, the total annual biomass production for the Access Trail site was measured at 1,509.95 pounds per acre, of which was comprised of 1,176.38 pounds of woody and 333.57 pounds of herbaceous plant species (Table 6).

East Slope

The East Slope, a much larger area than the above, was also dominated by fourwing saltbush, but not by such a large margin (Table 7). Other important species here by cover and frequency were bluebunch wheatgrass, western wheatgrass, shadscale, thickspike wheatgrass and Gt. Basin wildrye (*Elymus cinereus*). Total living cover in the area was estimated at 50.45% (Table 8-A) and was comprised of 57.26% grasses, 35.29% shrubs and 7.45% forbs (Table 8-B). For density, the total number of woody species was measured at 2,809 individuals per acre with dominants that included fourwing saltbush, shadscale and rubber rabbitbrush (Table 9). The total annual biomass production for the East Slope was 1,352.88 pounds per acre of which 769.65 came from woody and 583.23 from herbaceous plants (Table 10).

Bathhouse Slope

Another relatively large study area was the Bathhouse Slope. This area was dominated and nearly equally represented by Gt. Basin wildrye, rubber rabbitbrush, fourwing saltbush, bluebunch wheatgrass and shadscale (Table 11). The total living cover at this study area was quantified at 52.81% (Table 12-A). The lifeform composition of the cover consisted of 54.56% grasses, 40.24% shrubs and 5.20% forbs (Table 12-B). Woody species density for the Bathhouse Slope was measured at 3,824 plants per acre. The dominant shrubs in the density measurements were rubber rabbitbrush, shadscale and fourwing saltbush (Table 13). Lastly, the production at the site totaled 1,169.87 pounds per acre of which was nearly equally represented by woody and herbaceous plants (Table 14).

Deseret Mine

Next, the Deseret Mine study area was dominated by fourwing saltbush, Gt. Basin wildrye, rubber rabbitbrush, bluebunch wheatgrass, western wheatgrass and thickspike wheatgrass (Table 15). The total living cover at this site was 53.20% (Table 16-A) and was comprised of 53.09% grasses, 40.94% shrubs and 5.97% forbs (Table 16-B). Woody species measurements showed the area had a total of 2,870 plants per acre with the dominant shrubs being rubber rabbitbrush, fourwing saltbush, winterfat (*Ceratoides lanata*) and shadscale (Table 17). The total annual production was estimated at 1,302.17 pounds per acre and was comprised of 730.86 pounds of woody and 571.31 pounds of herbaceous plant species (Table 18).

Switchbacks

A relatively small area, the Switchbacks, was dominated by fourwing saltbush, western wheatgrass, thickspike wheatgrass and Gt. Basin wildrye (Table 19). This area had a total living cover of 46.25% (Table 20-A); the composition of it was 54.98% shrubs, 45.02% grasses and no forbs (Table 20-B). The total woody species density was measured at 3,008 individuals per acre and was greatly dominated by fourwing saltbush (Table 21). The total annual production here was 1,288.53 pounds per acre, most of which was comprised of woody plants (Table 22).

Substation

Another relatively small sample site was the Substation Area. The site was dominated by western wheatgrass, Palmer's penstemon (*Penstemon palmeri*), Gt. Basin wildrye and rubber rabbitbrush (Table 23). The Substation site had a total living cover of 38.50% (Table 24-A) and was comprised of 62.96% grasses, 21.33% shrubs and 15.71% forbs (Table 24-B). Total density for the woody plants was measured at 1,932 individuals per acre (Table 25). This density was dominated by rubber rabbitbrush, shadscale, fourwing saltbush and corymb buckwheat (*Eriogonum corymbosum*). The area had a total biomass production of 970.86 pounds per acre which was nearly equally represented by woody and herbaceous plant (Table 26).

Beehive/Little Dove Mine

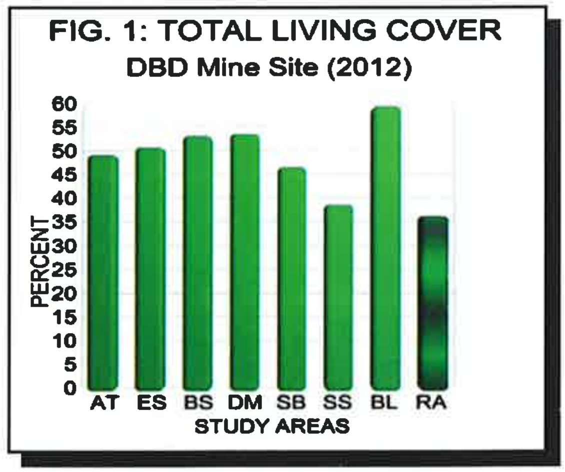
A somewhat larger area than the above two sample areas was the Beehive/Little Dove site. The site was dominated by fourwing saltbush, thickspike wheatgrass, western wheatgrass, Gt. Basin wildrye and bluebunch wheatgrass (Table 27). The total living cover for this area was estimated at 58.88% (Table 28-A); it had a composition of 67.25% grasses, 32.20% shrubs and 0.55% forbs (Table 28-B). Woody species density of the Beehive/Little Dove site had a total of 2,878 plants per acre and was dominated by fourwing saltbush, shadscale and rubber rabbitbrush (Table 29). Lastly, the total annual production of the area was 1,349.04 pounds per acre which consisted of 798.92 pounds of herbaceous and 550.12 pounds of woody plants (Table 30).

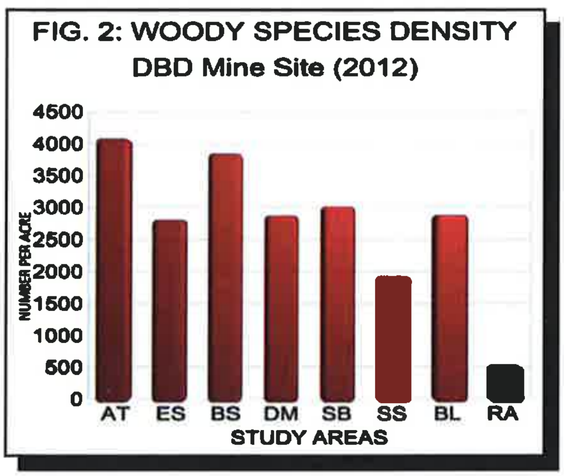
Pinyon-Juniper Reference Area

The Pinyon-Juniper Reference Area, or the area previously chosen to represent revegetation success standards, was also sampled in 2012 to make data comparisons with the reclaimed areas. This reference area was dominated by Salina wildrye, Mormon tea (*Ephedra viridis*), pinyon-pine and curl-leaf mountain-mahogany (*Cercocarpus ledifolius*). Table 31 lists all the species found in the sample quadrats by cover and frequency values. The total living cover of the reference area was 36.13%, of which 29.13% came from understory cover and 7.00% from overstory (Table 32-A). The understory cover had a composition of 63.85% grasses, 35.15% shrubs and no forb species (Table 32-B). The total woody species density of the area was 546 plants per acre and was dominated by pinyon-pine, Mormon tea, and curl-leaf mountain-mahogany (Table 33). The total annual biomass production for the reference area was 632.26 pounds per acre which was made up of 396.20 pounds of woody species and 236.06 pounds from herbaceous species (Table 34).

Comparisons of Separated Datasets

Provided below are graphic comparisons showing total living cover, woody species density, annual biomass production and diversity indices for each reclaimed study area described above. The summary data for the Pinyon-Juniper Reference Area have also been included in the graphs (Figs. 1-5)*.





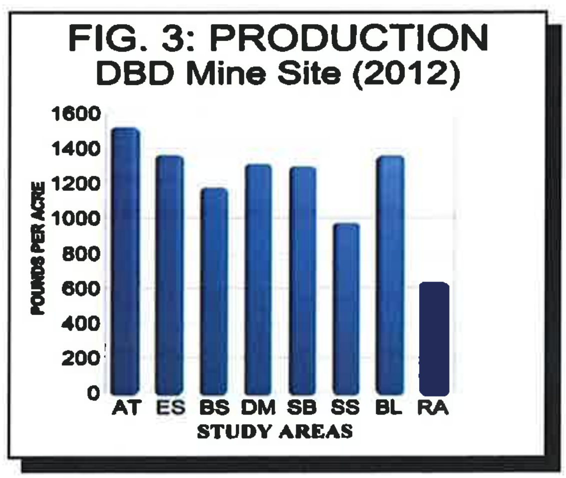


***Figure Legend**: **AT**=Access Trail; **ES**=East Slope; **BS**=Bathhouse Slope; **DM**=Deseret Mine; **SB**=Switchbacks; **SS**=Substation; **BL**=Beehive/Little Dove; **RA**=Reference Area.

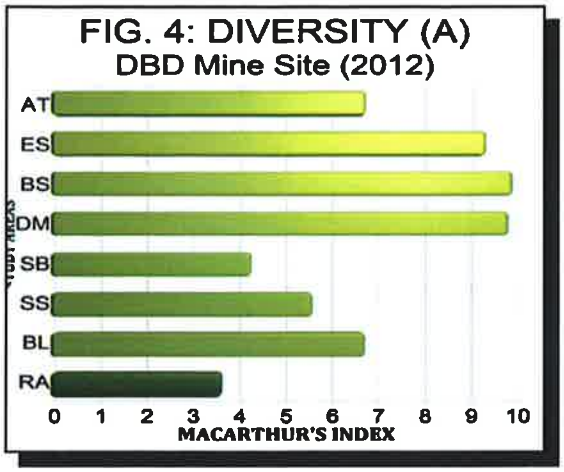
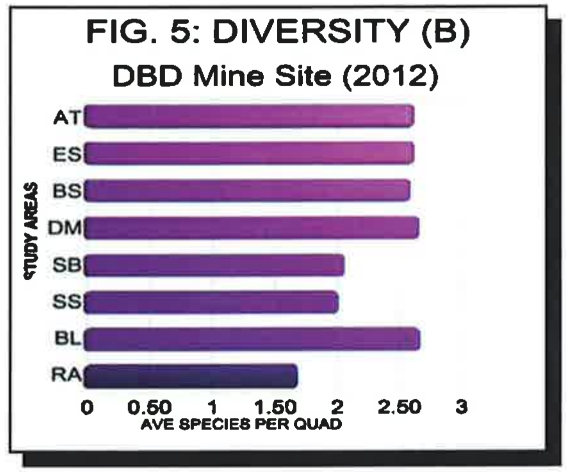




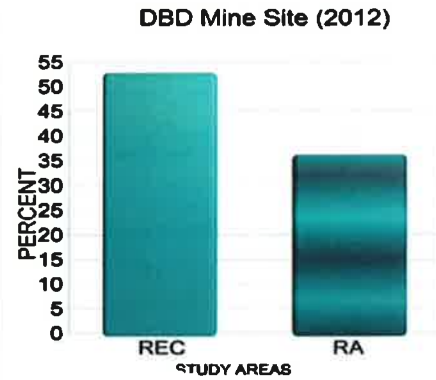
Separating vs Lumping Data

The section above provides the summary data for each study area including individual reclaimed sites as well as the reference area. As essential as it is to be able to review individual reclaimed areas by separating the datasets, lumping (combining) the data of the reclaimed study areas and comparing the key parameters statistically with the reference area, is the next most logical rational in the process of considering the reclaimed mine site for Phase III Bond Release.

***Figure Legend**: **AT**=Access Trail; **ES**=East Slope; **BS**=Bathhouse Slope; **DM**=Deseret Mine; **SB**=Switchbacks; **SS**=Substation; **BL**=Beehive/Little Dove; **RA**=Reference Area.

Lumped Datasets

FIG. 6: TOTAL LIVING COVER (LUMPED)



There was a significant amount of vegetation data collected at the Des-Bee-Dove Mine site in 2012 to measure the revegetation success and compare it to the success standards.

Though much data has been recorded in the area, the author has attempted to find a logical and straightforward method to compare the applicable parameters (those required by state and federal regulations) using statistics to determine revegetation success, yet also provide other meaningful data (that cannot readily be compared using statistics). Because the Des-Bee-Dove Mine site has been reclaimed to a single vegetation type (Pinyon-Juniper community), the site will only be compared to one reference area – the Pinyon-Juniper Reference Area. That said, for the parameters applicable to Phase III Bond Release that will be compared statistically, the reclaimed study sites have been lumped for comparisons with the reference area. Lumped dataset summaries have been provided in Tables 35 through 37; they have been compared to the reference area data mentioned earlier (Tables 32 through 34). Figs. 6-8 provides graphs of the lumped areas compared to the reference area.

FIG. 7: WOODY SPECIES DENSITY (LUMPED)

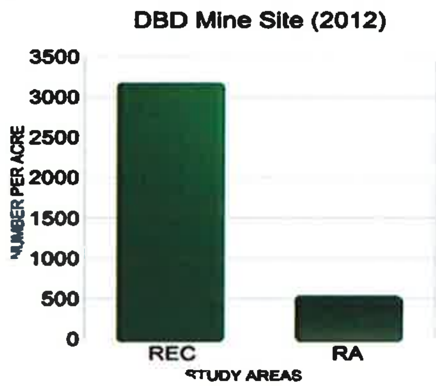


FIG. 8: ANNUAL PRODUCTION (LUMPED)

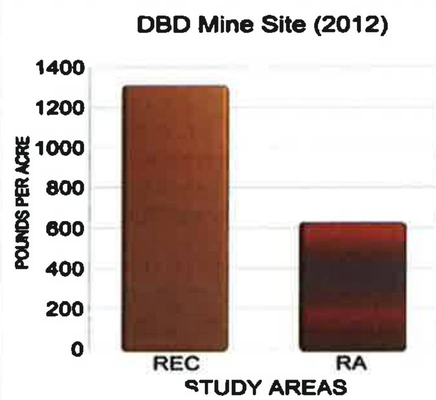

Statistical Comparisons

Statistical analyses comparing the reclaimed areas with the reference area for the fundamental parameters in determining the possibility for Phase III Bond Release have been employed. Student's t-tests indicate that for total living cover, woody species density and annual biomass production the reclaimed areas had statistical significant higher values for all of these parameters (Fig. 9).

FIG. 9. Statistical Analyses - Student's t-tests comparing total living cover, woody species density and annual biomass production for the *lumped* reclaimed and reference areas (2012).

Total Living Cover
Reclaimed Areas: $\bar{x}$=52.44; s=13.42; n=450
Reference Area: $\bar{x}$=36.13; s=7.62; n=40
t = 7.574; df = 488; SL= $p<0.01$

p = probability level

SUMMARY & CONCLUSIONS

After the coal mining activities terminated at the Des-Bee-Dove Mine the site was reclaimed and revegetated using a seed mixture that was conducive to restoring an approximation of the original native plant communities that were once supported in the area prior to their disturbance. Intensive quantitative vegetation sampling was conducted within these reclaimed areas in 2012. In accordance with state and federal regulations, specific standards for revegetation success had been determined prior to reclamation. This report provides the findings for the vegetation sampling and presents the data necessary for **Year 1** of *two consecutive years* to ascertain whether or not the mine site has met revegetation success standards, thus meeting requirements needed to ultimately apply for Phase III or Final Bond Release.

As a means to compare data for specific sites within the reclaimed areas, datasets were first presented *separately*. Later, data for the reclaimed areas were *lumped* (combined) making them more appropriate to be used for statistical comparisons with the reference area.

The *separated data* shows the differences between each study site *within* the reclaimed areas as well as comparisons with the reference area. It also shows additional information including lifeform composition, frequency, species presence and diversity as well as the more fundamental parameters such as total and living cover, density and annual biomass productivity.

The *lumped data* of the reclaimed sites focuses on the total living cover, woody species density and production. The summaries of the lumped datasets, when compared statistically with the reference area, suggest that they have met or exceeded those standards pre-determined for revegetation success.

In conclusion, the **Year 2** vegetation sampling for the second consecutive year will be conducted in 2013. Results from that study will be summarized as a companion to this 2012 study. If the results so warrant it, both sample years will be submitted with an application for Phase III Bond Release at the Des-Bee Dove Mine site in the near future.

TABLE OF CONTENTS

INTRODUCTION

The Des-Bee-Dove Mine is a site with a long history of coal mining activities dating back to at least 1898. In 1987 the mining activities were terminated and the site went into what is called *temporary cessation*. In 2003, most of the disturbed areas of the mine site were reclaimed to their approximate pre-mining contours and then re-seeded with native plant seed mixtures. The only areas not reclaimed at that time were those that were to remain for the purpose of sediment control measures for the newly establishing vegetation. These areas were the Sediment Pond Area and the access road to it. Ultimately, in 2006 the *Sediment Pond Area* and *Access Road* were also reclaimed.

Because the Des-Bee-Dove Mine site was reclaimed 2003, the *10-Year "Responsibility Period"* is approaching and *Phase III* or *Final Bond Release* may soon be possible. Consequently, in 2012, or Year 9 following reclamation activities, vegetation at the mine site was sampled to provide the first of two consecutive years necessary to be submitted for bond release considerations through the State of Utah, Division of Oil, Gas & Mining (DOGM). Even though the Sediment Pond and its access road were reclaimed later, because they were only temporarily retained for sediment control reasons, they too may be considered for final bond release at the end of the aforementioned Responsibility Period. Therefore, the purpose of this report is to provide revegetation monitoring data to ascertain whether or not these remaining areas have become established enough to also be considered for Phase III Bond Release through DOGM.

In order to achieve approval for Phase III Bond Release, vegetation of a reclaimed mine site must meet specific standards for revegetation success. Consequently, a "reference area", or a native, undisturbed plant community is often chosen beforehand to provide future success standards following final reclamation. Prior to disturbance by mining activities, the native vegetation in the Sediment Pond Area was mostly dominated by plant communities supporting saltbush species (*Atriplex* spp.), pinyon-pine (*Pinus edulis*) and Utah juniper (*Juniperus osteosperma*). Subsequently, the native plant community chosen to be compared to the reclaimed Des-Bee-Dove Sediment Pond Area was located in close proximity to the reclaimed areas and was called the Saltbush Shrub Reference Area.

METHODS

Transect Placement

Transect lines for quantitative sampling were randomly placed for the entire length of the reclaimed Sediment Pond Area, the reclaimed Access Road and the Saltbush Shrub Reference Area. From these transect lines, sample locations were chosen using random numbers on both sides and at right angles to them.

Cover, Frequency & Composition

Cover estimates were made using ocular methods with meter square quadrats. Species composition and relative frequencies were also assessed from the quadrats. Plant nomenclature follows *"A Utah Flora"* (Welsh et al. 2008).

Density

Density estimates for the woody plant species on the reclaimed and reference areas were made using a distance method called the point-quarter technique. In this method, random points were placed on the sample sites and measured into four quarters. The distances to the nearest woody plant species were then recorded in each quarter. The average point-to-individual distance was equal to the square root of the mean area per individual.

Sample Adequacy

Sample adequacy for cover, density and production was attempted with the goal that 90% of the samples were within 10% of the true mean for the plant communities in the area. The following formula was used:

$$nMIN = \frac{t^2 s^2}{(dx)^2}$$

where,

nMIN	= minimum adequate sample
t	= appropriate confidence t-value
s	= standard deviation
x	= sample mean
d	= desired change from mean

Diversity

Two diversity indices have been employed to the datasets for comparisons. To begin, *MacArthur's Diversity Index* was calculated. This index is an effective diversity measurement and is computed using the equation $1/\sum pi^2$ (MacArthur and Wilson 1976, The Theory of Island Biogeography, Princeton: Princeton University Press). In this equation *pi* is the proportion of sum frequency contributed by the *i*th species in the sample area of concern. The proportional contribution of each species is then squared and the values for all species in the sample areas are summed. This index integrates the number of species and the degree to which frequency of occurrence was equitably distributed among those species. In other words, this index provides greater weight to those species that are present more often (with greater frequency) than those that are merely "present" in one or two quadrats.

The *Average Number of Species* per sample quadrat is another measure of species diversity provided from the data in this report.

Photographs & Sample Location Maps

Color photographs were taken of the sample areas and have been included in this report. Maps showing the sample areas have also been included.

RESULTS

The reclaimed *Sediment Pond Area* (Map 1) dataset was separated from the reclaimed *Sediment Pond Access Road* (Map 2) in this report to enable a more accurate depiction of each revegetated area individually rather than lumped together. Subsequently, the data of reclaimed areas were compared with that of the *Saltbush Shrub Reference Area* (also shown on Map 1).

Color photographs and maps of the sample areas have been included following the Summary Tables in this report.

Sediment Pond Area

The dominant plant species in the reclaimed Sediment Pond Area were four-wing saltbush (*Atriplex canescens*), Gardner saltbush (*A. gardneri*), western wheatgrass (*Elymus smithii*) and Gt. Basin wildrye (*Elymus cinereus*). There were several other species present in the area, all of which are shown on Table 1.

The total living cover of the Sediment Pond Area was estimated at 43.25% (Table 2-A). Of that total, 62.40% was represented by shrub species, 36.69% grasses and 0.91% were forbs (Table 2-B).

Woody species density was also recorded. The total density of the area was estimated at 5,711 individuals per acre (Table 3). The density was mostly comprised of four-wing saltbush, Gardner saltbush, prostrate kochia (*Bassia prostrata*), winterfat (*Ceratoides lanata*), rubber rabbitbrush (*Chrysothamnus nauseosus*) and shadscale (*Atriplex confertifolia*).

Finally, total annual biomass production at the site was estimated at 1,507.60 pounds per acre; this total consisted of 1,183.15 pounds from woody plants and 324.45 pounds from herbaceous species (Table 4).

Sediment Pond Access Road

No single plant species dominated the Sediment Pond Access Road by a wide margin. The most common plants, however, were prostrate kochia, western wheatgrass, thickspike wheatgrass (*Elymus lanceolatus*) and rubber rabbitbrush (Table 5).

The total living cover for the access road area was estimated at 26.29% (Table 6-A), of which 46.15% were shrubs, 41.41% grasses and 12.44% were forb species (Table 6-B).

The total density of the Sediment Pond Access Road was estimated at 1,894 individuals per acre and was dominated by rubber rabbitbrush, prostrate kochia, broom snakeweed (*Gutierrezia sarothrae*), shadscale and fourwing saltbush (Table 7).

Productivity of the area had a total of 523.47 pounds per acre; the production was comprised of 355.80 pounds from woody plants and 167.67 pounds from herbaceous species (Table 8).

Saltbush Shrub Reference Area

The area chosen to be compared to the reclaimed areas and to represent final revegetation success standards was called the Saltbush Shrub Reference Area. The dominant species in this area were Salina wildrye (*Elymus salinus*), Gardner saltbush and shadscale. All species listed by cover and frequency in the reference area are shown on Table 9.

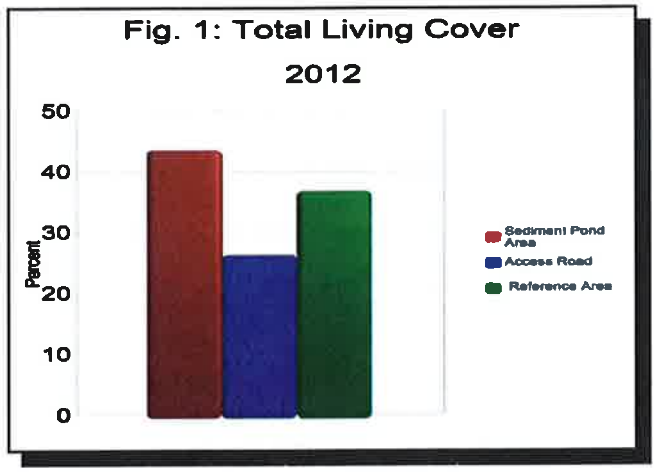
The total living cover for the reference area was estimated at 36.63% (Table 10-A). The cover's lifeform composition was comprised of 55.70% shrubs, 44.30% grasses, with no forbs encountered in the samples (Table 10-B).

Woody species density in the reference area totaled 4,384 individuals per acre and was dominated by Gardner saltbush, shadscale and corymb buckwheat (*Eriogonum corymbosum*). For a list of all density estimates refer to Table 11.

The total annual biomass productivity in the reference area was measure at 711.91 pounds per acre. This total consisted of 410.67 pounds from woody plants and 301.24 pounds from herbaceous species.

Total Living Cover Comparisons

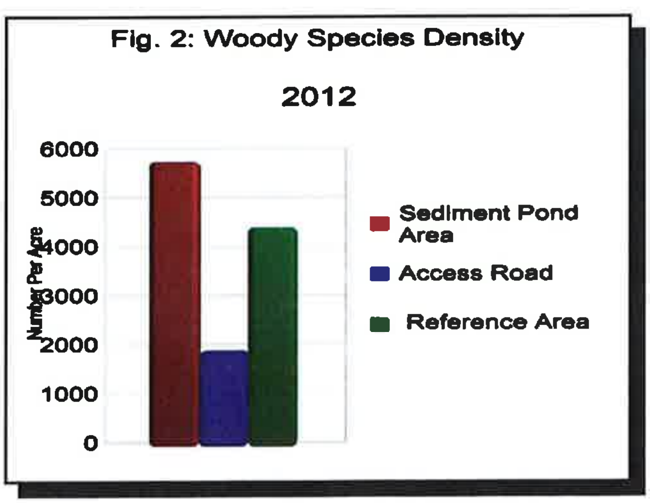
The results described above indicate that the total living cover of the Sediment Pond Area is greater than that of the Saltbush Shrub Reference Area. The opposite is true for the Access Road. Fig. 1 is a graph that shows this comparison.



When statistics were employed to test whether or not the differences are significant, the analyses suggested that they are – the Sediment Pond Area had a statistically significant greater amount of total living cover than that of the Saltbush Shrub Reference Area. Moreover, the Access Road had significantly less cover (Fig. 6-A).

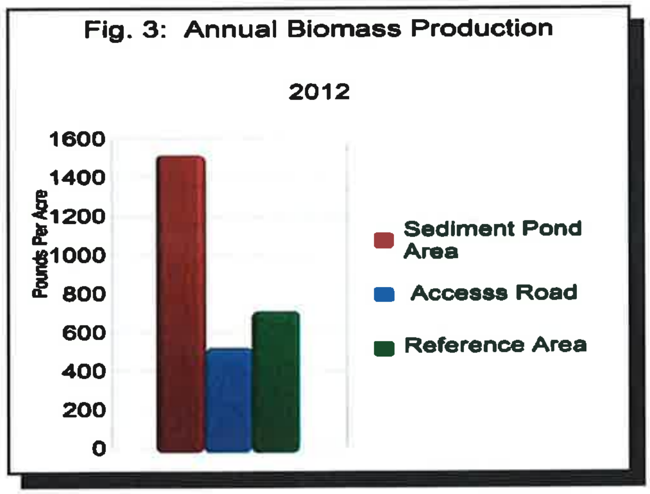
Woody Species Density Comparisons

When the total woody species densities for all areas were compared, the results were similar as the cover results (Fig. 2). The Sediment Pond Area had more plants per acre and the Access Road had less than the reference area. These differences were also statistically significant (Fig. 6-B).



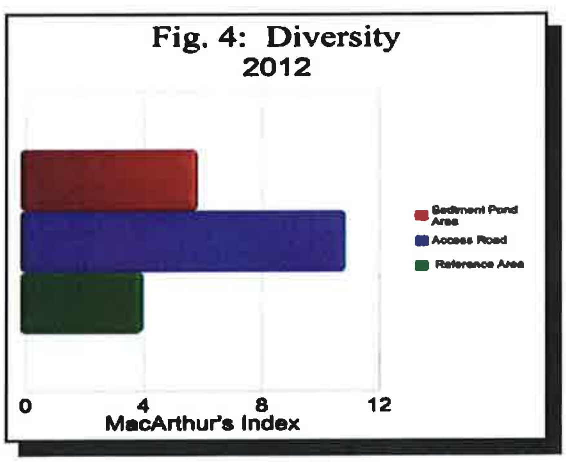
Annual Biomass Production Comparisons

When the total annual biomass production was compared, the results again were similar to the above results (Fig. 3). The Sediment Pond Area had greater production and the Access Road had less than the reference area. These differences were again statistically significant (Fig. 6-C).



Diversity Comparisons

Two diversity measurements were calculated on the datasets for comparison purposes. First, MacArthur's Index was employed. Using this index, both the Sediment Pond and the Access Road areas were more diverse (Fig. 4). Next, the Average Number of Species per Quadrat indicated that the reference area has slightly more that both reclaimed areas (Fig. 5).



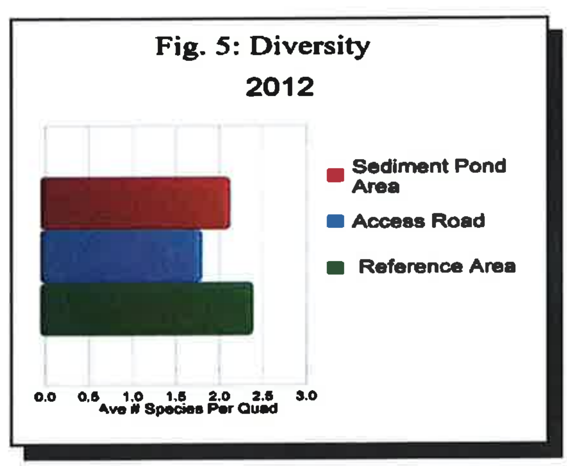


FIG. 6. STUDENT'S T-TEST - Total living cover, woody species density and annual biomass production comparisons between the reclaimed and reference areas (2012).

A. Total Living Cover

Reclaimed Sediment Pond: $\bar{x}$=43.25; s=12.40; n=80
Saltbush Shrub Reference Area: $\bar{x}$=36.63; s=10.42; n=80
t = 3.656; df = 158 ; SL= p<0.01

Reclaimed Access Road: $\bar{x}$=26.29; s=11.91; n=120
Saltbush Shrub Reference Area: $\bar{x}$=36.63; s=10.42; n=80
t = 6.318; df = 198; SL= p<0.01

B. Woody Species Density

Reclaimed Sediment Pond: $\bar{x}$=5711.02; s=2382.59; n=80
Saltbush Shrub Reference Area: $\bar{x}$=4384.22; s=2098.54; n=80
t = 3.738; df = 158 ; SL= p<0.01

Reclaimed Access Road: $\bar{x}$=1893.68; s=1793.97; n=120
Saltbush Shrub Reference Area: $\bar{x}$=4384.22; s=2098.54; n=80
t = 8.980; df = 198; SL= p<0.01

C. Annual Biomass Production

Reclaimed Sediment Pond: $\bar{x}$=1507.60; s=473.23; n=80
Saltbush Shrub Reference Area: $\bar{x}$=711.91; s=222.79; n=80
t = 13.607; df = 158; SL= p<0.01

Reclaimed Access Road: $\bar{x}$=523.47; s=278.21; n=120
Saltbush Shrub Reference Area: $\bar{x}$=711.91; s=222.79; n=80
t = 5.070; df = 198; SL= p<0.01

$\bar{x}$= sample mean

df = degrees of freedom
SL = significance level
p = probability level

SUMMARY & DISCUSSION

Most of the Des-Bee-Dove Mine site was reclaimed in 2003, however, because they were retained for sediment control purposes, the Sediment Pond Area and the Access Road were reclaimed and reseeded later in 2006. For reclaimed sites, mine land operators have a 10-year time-frame before an application can be submitted to the State of Utah for *Phase III* or *Final Bond Release*. This time period, called the *Responsibility Period,* is thought to be long enough to be able to judge whether or not reclaimed lands are established enough to have met pre-set standards of revegetation success. This applies to nearly all reclaimed areas at the mine sites, however, one exception may include those areas that have been temporarily retained to control sediments from runoff during the initial plant establishment period. The *Responsibility Period* for these areas may be somewhat shorter if they meet state and federal requirements. Generally speaking, the reestablished vegetation cover must be: a) diverse, effective, and permanent, b) the plant species be compatible with the approved post-mining land use, c) will have the same seasonal characteristics of growth as the original vegetation, d) are capable of self-regeneration and plant succession and e) be compatible with the plant and animal species of the area. To meet these requirements, specific parameters of the reclaimed areas are often compared with a reference area, or a native plant community with characteristics similar to those of the mine site's plant communities before they were disturbed by mining activities. In other words, the reference area is used to drive or set the revegetation success standards for the reclaimed lands.

The datasets for the Sediment Pond Area and Access Road at the Des-Bee-Dove Mine site have been compared to the Saltbush Shrub Reference Area. It appears that when cover by species, frequency, lifeform composition, total living cover, woody species density, annual biomass productivity and diversity of the reclaimed Sediment Pond Area are compared statistically (or otherwise) to the reference area, this area may be approaching the requirements necessary for *Phase III Bond Release*. The small incremental area of the Access Road, however, is not establishing equally as that of the Sediment Pond Area and may be deficient for meeting the requirements of the success standards.

Energy West Mining Company

Annual Subsidence Monitoring Report

East and Trail Mountain Properties – 2012

INTRODUCTION

Energy West's East Mountain/Trail Mountain subsidence monitoring study is an ongoing project designed to detect, observe, and report the effects of mining-induced subsidence above the Deer Creek, Trail Mountain, Wilberg/Cottonwood, and Des-Bee-Dove Mines (see Figure 1). This is the thirtieth such annual report submitted, and covers the period between September 1, 2011 and September 30, 2012.

The initial report submitted in 1982 details the monitoring methods used in the study; therefore, they are not discussed in depth here. Energy West uses aerial stereo photogrammetric survey methods and annual helicopter reconnaissance flights to monitor subsidence.

The aerial stereo photogrammetry work is contracted to a commercial mapping company. Contracts for the work are bid and awarded for three-year periods. Between 1982 and 1987 the work was contracted through Intermountain Aerial Surveys. IAS established reading points on generally a 200-foot grid but adjusted the location of each point to be on easily reproducible locations. Between 1988 and 1990 the work was contracted to Maps Inc. Maps, Inc. used a 200-foot uniformly spaced grid. In 1991 the work was contracted to MapCon mapping consultants. The owners of this company were previously employed by Intermountain Aerial Surveys and felt that better results could be obtained by using the original grid established by Intermountain Aerial Surveys.

Using the aerial photographs derived from the flight conducted on October 1, 2012, elevations were measured at 7,470 different points. These elevations were then compared with the baseline survey elevations measured from the aerial photos collected in 1980, 1986, 1987, 1994 and 2000. The difference in elevation between the original surveys and the 2012 survey constitutes the total amount of subsidence that has occurred. A reconnaissance helicopter overflight on October 4, 2012, did not reveal any new surface effects from subsidence since 2011.

Raw data is included as an appendix to this report in an Excel file called 2012-sub.xls. The aerial reconnaissance flight in October of 2012 revealed no new fracturing or visible signs of subsidence in any of the other monitored areas.

Prior to PacifiCorp's acquisition of the Trail Mountain Mine from ARCO Coal Co. in 1992, subsidence was monitored with conventional ground monuments and transit surveys. Between 1992 and 2001, when the mine was closed, photogrammetric methods were used. Longwall mining was completed in the Trail Mountain Mine in 2001, and the mine was closed shortly thereafter. Subsidence at Trail Mountain has been documented in previous reports.

Location

Figure 2 shows areas above current mining areas at Energy West's mines that have potential for mining-induced subsidence. In 2012 two areas of potential subsidence were monitored and mapped. In areas where subsidence has been detected, data is shown in the form of contour maps and profiles.

Lease Relinquishment and Reduction in Subsidence Monitoring

Several portions of the original mine leases have been relinquished on East and Trail Mountains, which means that subsidence in those areas has been shown to be complete enough for the relinquishment to take place. Having relinquished these areas, or in the case of area 12, where no measurable subsidence has occurred, Energy West will no longer report on the subsidence conditions for those areas. Three of the original twenty-five areas chosen for subsidence monitoring were either incorporated into other maps (Areas 9 and 10) or not been represented on an individual map (Area 12) due to complete lack of subsidence over time. These areas are still mentioned in the report, but are not shown on individual maps or profiles. Other areas where mining has not occurred for 5 years or more are considered to be completely subsided. They are: 1-7, 9-12, and 14-26, covering the old mine areas including Rilda Canyon Ridge. Also, all areas above the Des-Bee-Dove mines (areas 8 and 13) are considered to be completely subsided. Of the original 25 areas that have been chosen for subsidence monitoring, 2 are detailed in this report: 27

and 28. Area 27 covers the first district of Hiawatha seam longwall panels in the Mill Fork Lease, and Area 28 covers the district of Blind Canyon seam longwall panels and the second district of Hiawatha seam panels (District 2) in the Mill Fork Lease. Mining in these areas has been from 2003 to present. Future lease relinquishments will result in further reduction in monitoring of the older areas.

Since June 1998, four survey points have been monitored annually for subsidence in the right fork of Rilda Canyon directly above the 5th North Mains in the Blind Canyon seam where 5th North crosses under the stream bed in the right fork (Figure 3). This is an area of first mining only, with longer pillars and offset crosscuts specifically designed to prevent subsidence. One of the points has disappeared, but the others are still being surveyed. As of the last survey date in August, 2012, no significant movement of any of the points has ever occurred. A tabulation of the point surveys is attached to this report.

Area 27

Deer Creek Mine Mill Fork Lease Area – 12th , 14th , 15th, 16th and 17th West Longwall Panels ("District 1")

The Mill Fork State Lease (ML-48258) and the Mill Fork Lease Extension (UTU-84285) form a large lease area to the northwest of the original Deer Creek Mine workings. This lease will be the primary mining area for the Deer Creek Mine for the next several years. Reserves exist in both the Blind Canyon and Hiawatha seams, and a sizeable area of dual-seam mining is projected for the central part of the lease. Overburden is very deep in the Mill Fork Lease, ranging from about 1,000 feet up to over 2,600 feet. The first longwall mining was in the Hiawatha seam, in the deepest area, from south to north for 5 panels in the southern end of the Mill Fork Lease (called District 1). Only single-seam mining will take place in the District 1 area.

The first longwall mining in District 1 in the Hiawatha seam took place in August of 2005. By the date of the 2012 survey, the mineable portions of five (5) panels had been completely extracted: 12th, 14th, 15th, 16th, and 17th West.

Noticeable subsidence has occurred above the combined areas of 12th through 17th West panels (District 1) as of the date of this report; just over 6 feet total so far (Figure 3, Profile Charts 1 and 2). Subsidence has increased in the area of the profiles to just over 5 feet.

Area 28 (Present Mining Area)

Deer Creek Mine Mill Fork Lease Area – 2nd, 3rd, 4th, 5th, 6th, and 7th Left Longwall Panels (Blind Canyon Seam, "District 2"), 21st, 22nd, 23rd, 25th West Longwall Panels (Hiawatha Seam, "District 2")

The Mill Fork Lease UTU-88554 (changed from State Lease ML-48258 on September 1, 2011) and the Mill Fork Lease Extension (UTU-84285) form a large lease area to the northwest of the original Deer Creek Mine workings. This lease is the primary mining area for the Deer Creek Mine for the next several years. Reserves exist in both the Blind Canyon and Hiawatha seams, and a sizeable area of dual-seam mining is projected for the central part of the lease. Overburden is very deep in the Mill Fork Lease, ranging from about 1,000 feet up to over 2,600 feet. Area 28 covers the second panel "district" in the Blind Canyon seam (called District 2), just to the north of the 1st Hiawatha panel district (described as Area 27) in the lease. The first longwall mining in Mill Fork District 2 in the Blind Canyon seam took place in February of 2008. By the date of the 2010 survey, all 6 of the Blind Canyon panels had been extracted: 2nd, 3rd, 4th, 5th, 6th and 7th Left. Only a small portion of 4th Left panel was actually mined; the majority of the panel was left in place as a protective support barrier under the highest cover. (Figure 4, Profile Charts 3 and 4). In the Hiawatha Seam, the narrow 21st West panel was completely extracted in 2011; this is the first dual-seam mining area in the Mill Fork Lease to be mined. 21st West panel is located entirely within the gob shadow of the 5th Left Blind Canyon panel. Small but noticeable subsidence had occurred in 2011. During 2012, five longwall panel areas were mined: 22nd West Inby, 22nd West Outby, 23rd West Inby, 23rd West Outby and part of 25th West Inby. Maximum subsidence so far over this area has been just over 10 feet. The increase from 3 feet to 10 feet is certainly due to the larger area of dual seam mining that has been created in the 22nd – 23rd West outby region. Reasons for less than expected subsidence and inconsistent profiles even in the dual seam mining area from year to year may include: irregular mining pattern, very thick overburden, up to 2,600 feet, abundant clay strata in the upper formations, especially the North Horn formation, and very steep topography, which decreases monitoring point accuracy. A second set of profiles, Area 28 N-S New and Area 28 W-E New (Profile Charts 5 and 6), were added to better measure the subsidence in 5th, 6th, and 7th Left panels. Dual-seam longwall mining in this area began in December, 2010, with the startup of 21st West longwall panel in the Hiawatha seam. 21st West panel was probably too narrow, at 450 feet, to have contributed to the overall subsidence in this dual seam area. The addition of 22nd West Outby and 23rd West Outby have opened this area to critical width.

Predicted Maximum Subsidence

A comparison between observed and predicted maximum subsidence for the various areas on Energy West's property has been made using a method developed by the British National Coal Board (NCB). The NCB method utilizes graphs compiled from numerous field observations and takes into consideration the length and width of the mined-out area, thickness of coal extracted, and depth of cover. The method is claimed to be correct to ±10% in the majority of cases, assuming certain limiting conditions are met. The table below compares predicted maximum subsidence with observed subsidence for areas on East Mountain.

Area	**Subsidence (feet)**		
	Predicted Maximum	**Observed**	**% of Predicted**

28 Deer Cr. Mill Fork 2 – 7L B.C., 21W, 22W, 23W Hia.–Dual Seam	16	10.0	41

* This area does not fit the NCB prediction model.

In most areas subsidence is less than the maximum predicted by the NCB model. The average of the 30 areas is 88.8% of the predicted values for those areas. The observed subsidence shown here represents the actual maximum subsidence for the particular geologic conditions -- probably the case in some areas since subsidence appears to have ceased in several areas where the NCB predicted maxima were not reached. In areas showing greater than expected subsidence, chain pillars or barriers between sections are probably crushing so that strata above the workings cave as it would if a wider zone had been mined.

Mitigation of Surface Effects

Prior to mining in an area, Energy West notifies the land owner that mining will be in progress beneath his property. The land owners within the permit boundary are as follows:

Karl A. Seely, Inc.

LDS Church

USDA Forest Service

Elk Springs Property Users Association

Kent Barton

PacifiCorp

State of Utah Institutional Trust Lands Administration

McKinnon Estate

Lavar Jensen & Phyllis Jensen

Energy West will continue to notify those owners prior to undermining their properties. Over most areas where subsidence has been observed on East Mountain, present land use has not been affected in any way. Areas 2, 5, 6, 8, 9, 10, 12, 13, 15, 16, 17, 18, 19, 20, 23, 24, and 26 are good examples of subsidence without visible surface disturbance or adverse hydrologic effects. In such areas no mitigation is necessary.

In a few areas, such as Areas 1, 3, 4, 7, 10, 11, 14, 21 and 22, 24, and 25, surface fractures have been detected. In order to protect livestock PacifiCorp erected a fence around Area 1 (since removed) where fractures are of sufficient magnitude to pose a threat to wandering cattle. In the regions where the fractures could be reclaimed they have been filled in with heavy equipment and the escarpments have been evenly contoured and reseeded. In Area 4, the small tension fractures that formed were reclaimed by filling in the fractures using a motor-grader and reseeding the area. In Area 14, where cracks have also been observed, these were filled in by hand in 1998 and reseeded. The U. S. D. A. Forest Service accepted this mitigation as being sufficient and complete. In area 25, a large fracture above the Castlegate Sandstone was filled to prevent hazardous conditions at the surface.

In Areas 3, 7, 10, 11, 21, 22, 24, and 25, where only minor fracturing has occurred on remote ridges and/or where land use has not been affected, more damage would be done by gaining access to and repairing or fencing fractures than can be justified. Therefore, mitigation is counterproductive in those areas and is not planned.

Summary

As of September 2012, PacifiCorp has identified two (2) areas for continuing study of mining-induced subsidence on the East Mountain/Trail Mountain property. Terrain in the subsidence study areas ranges from relatively flat mountain tops with thick overburden of up to 2,600 feet to steep slopes and cliffs with overburden of less than 800 feet. The mine plan for the 2 study areas has been designed to avoid cliff areas with second mining or 2-seam second mining. Second mining areas are kept outside of a 15 degree angle of draw from any Castlegate Sandstone cliff areas. This generally corresponds to 1,000 feet of overburden or greater above the projected second mining areas.

In areas where overburden is thicker and other more clay-rich formations are present above the mine workings, longwall and room-and-pillar mining methods have allowed the multiple seam mining of large quantities of coal without apparent impact on the surface environment because the overburden yields through plastic deformation. More than eighty percent (80%) of the East Mountain property has conditions similar to those areas; therefore, the mining methods being utilized are well suited to the geologic conditions, allowing subsidence to occur without impacting the hydrology or present land use of the area.

An effort was made again this year to predict maximum possible subsidence for the various areas where subsidence has been detected. The prediction was then compared with observed subsidence for each area. It appears that the actual subsidence occurring on East

Mountain/Trail Mountain is slightly less than that predicted by the NCB model.

Professional Certification of Subsidence Data

I, Kenneth S. Fleck, being a Licensed Professional Geologist in the State of Utah (#5224883-2250), with significant experience in subsidence monitoring, certify that the subsidence data contained in this document was collected under my direction, and the attached subsidence materials were prepared by me using industry-accepted methods. I further certify that the interpretations contained herein are an accurate representation of the subsidence that has occurred.

Dated this 13th day of February 2013.

Kenneth S. Fleck

Professional Geologist

I. INTRODUCTION

The 2012 Hydrologic Monitoring Report is hereby submitted in accordance with the U.S. Department of Interior, Office of Surface Mining requirements and the Utah State Division of Oil, Gas and Mining guidelines for hydrologic monitoring in areas of and adjacent to coal mining operations.

This is the thirty-fifth annual hydrologic report submitted by PacifiCorp since the report entitled "Monitoring of the Water Resources in the Mining Areas of East/Trail Mountain, Emery County, Utah" was submitted to the U.S. Geological Survey and the Utah Division of Oil, Gas and Mining in December 1977. It addresses flow observations and water quality characteristics of the water resources adjacent to PacifiCorp's mining areas in Emery County. (See Figure 1, A & B)

Information was compiled the past year from in-house as well as from state and federal agencies and private sources as follow:

U. S. Geological Survey
U. S. Forest Service
National Oceanic and Atmospheric Administration
Utah Division of Oil, Gas and Mining
Castle Valley Special Services District
Emery Water Conservancy District
North Emery Water Users Special Services District

Information from outside agencies will continue to be utilized each year for as long as their data gathering programs continue. As a result, cooperative effort is realized and duplication of effort and expense is substantially reduced.

II. CLIMATIC OBSERVATIONS

In general, runoff and subsequent water supplies are a direct function of the climatic conditions in any given area. Furthermore, the significance of the weather affecting the flow characteristics of the East/Trail Mountain springs cannot be over-emphasized.

Most of the water supply in the Western United States originates in the high mountain ranges as snowfall during winter periods. Snowmelt augmented by spring precipitation produces runoff which is utilized downstream. Fall precipitation influences the soil moisture conditions prior to snowpack accumulation and has a bearing upon runoff the following year.

A. Regional Climatology

From 1982 to 1984 the Western United States, especially Utah, experienced an unprecedented wet cycle of precipitation. The pattern changed in 1985 with conditions returning to slightly above normal. During the 1986 water year, the extremely wet trend returned, and the upper Colorado River Basin experienced above average precipitation. The 1987 weather pattern changed dramatically with near normal valley precipitation and mountain snowfall much below normal. The resulting 1987 runoff was substantially below normal. The drought continued from 1988 through 1992 with runoff amounts much below normal for six consecutive years. The 1993 runoff improved substantially with above average flow conditions occurring in most river basins. In 1994, drought conditions returned throughout much of the West. From 1995 through 1999, water supplies were much improved with above average runoff in Emery County. In 2000, weather conditions changed dramatically and the resulting runoff was much lower than normal. Precipitation was variable during 2001 and runoff values continued below normal though the year. The drought continued into 2002 with much lower precipitation and runoff was near-record low levels for most streams in Emery County. The 2003 water year was nearly as severe as 2002 with flows less than 40%. The extreme dry trend continued through 2004 with precipitation and runoff much below average although 2004 was much improved over the previous 4 years. Finally, in 2005 and 2006 wet conditions returned to the West and resulted in improved water supplies in the Huntington Creek drainage. Most local reservoirs filled to capacity. However, extreme drought returned to the region once again in 2007. Below average precipitation and snowfall coupled with dry and hot conditions in March and April resulted in greatly reduced water supplies which, in turn, severely restricted irrigation water supplies during August and September. However, from 2008 through the 2010 water years, drought conditions eased in the region, filling the reservoirs to capacity, resulting in more abundant water supplies for agriculture and culinary uses. The 2011 water year showd the region with near record precipitation. The wet cycle of precipitation mimicked the amounts seen in the early 80's. Spring runoff lasted well into the summer months. Many of the drainages in Emery County swelled beyond their banks.

The water year for 2012 began variable with greatly reduced precipitation. Total precipitation was 50% or less than those amounts recorded for 2011 for all reporting locations. Historical averages were 58%, 86%, 76% of normal for Castle Dale, Huntington, and East Mountain reporting stations respectively. Temperatures were generally above normal for all reporting locations.

B. Local Climatology

1. Precipitation

Precipitation amounts recorded for the 2012water year will be presented for the Castle Dale, Huntington Plant, and East Mountain weather stations. Weather records were incomplete for Electric Lake during 2012 and therefore, are not included with this report. This station has been eliminated and will no longer be reported. The values for Castle Dale, Huntington and East Mountain are shown in Table 1.

Precipitation in Emery County during 2012 was variable depending on the location. Precipitation at the valley reporting station at Castle Dale was only 61% of normal while precipitation at Huntington Plant was 78%. East Mountain precipitation reported 76% of average.

A comparison of precipitation totals for 2011 and 2012 merits consideration in this study. The intent is to develop a correlation between yearly precipitation and spring discharges on East and Trail Mountains. Table 2 is a comparison of the 2011 and 2012 precipitation levels recorded at the three locations.

Tables 3, 4, 5, and 6 indicate monthly precipitation values at Castle Dale, Huntington, Electric Lake (no longer recorded), and East Mountain from the beginning of operation at each site. The tables indicate monthly trends as well as the great fluctuation in yearly totals. Figure 2 shows monthly precipitation at the East Mountain site for the 2012 water year.

The correlation of precipitation levels with spring discharges will be discussed in the East/Trail Mountain Springs section of this report.

2. Temperatures

During the 2012 water year, temperatures were above normal at Castle Dale and Huntington Plant. Temperatures at the East Mountain station were generally above normal. Temperatures at Castle Dale were above normal throughout the year with temperatures between 3.2 to 5.2 degrees above historical averages from March through June. For the year, the average temperature was 3.6 degrees above normal.

At Huntington temperatures were generally above normal throughout the year. For the year the average annual temperature was 1.2 degrees above normal compared to 2011 where the temperature was 1.4 degrees below normal.

At the East Mountain station, temperatures were variable throughout the year. March through June recorded above normal departures of 3.7 to 7.3 degrees. For the year, the temperature at East Mountain averaged 2.4 degrees above normal which mirrored the results from 2011. Temperatures at the Electric Lake station were not recorded. (See Table 7 for temperature data at the 3 stations.)

A comparison of 2011 and 2012 temperatures for the three stations is addressed since temperatures also influence water supplies from year to year. Table 8 depicts the variation and compares 2011 to 2012.

III. DRAINAGE SYSTEMS

The surface drainage system on East Mountain is divided into two major drainages; the southwest portion forms part of the Cottonwood Creek drainage, and the northeast portion contributes to the Huntington Creek drainage. (See Map HM-1) The drainage boundaries, including minor subdivisions to Cottonwood and Huntington creeks, are designated on the accompanying map. The surface drainage system on Trail Mountain is totally contained within the Cottonwood Creek drainage system, with minor subdivisions flowing to Indian and Cottonwood Canyon creeks. (See Plate 7-2) Both Huntington and Cottonwood creeks flow out of the Wasatch Plateau in a southeasterly direction. The creeks merge with Ferron Creek to form the San Rafael River, which is a tributary of the Green River.

A. Huntington Creek Drainage System

Huntington Creek is comprised of many smaller tributary streams that feed the main stream. Deer Creek, Meetinghouse Canyon, Mill Fork Canyon, Rilda Canyon, and a portion of Crandall Canyon creeks are the only tributaries to Huntington Creek that emanate from within PacifiCorp's coal mining areas.

1. Huntington Creek

Flow data are recorded on a continuous basis by PacifiCorp at three locations; stations are located on 1) Huntington Creek near PacifiCorp's Huntington Plant, 2) Huntington Plant Diversion, and 3) Huntington Creek below Electric Lake about 22 miles upstream from the Huntington Plant. Flow records are maintained by PacifiCorp in order to determine water entitlements and reservoir storage allocation for the various users on the river.

Table 9 shows a summary of actual recorded Huntington Creek flows below Electric Lake and above Huntington Plant. The average daily discharges for the 2012 water year (October 2011 - September 2012) at the two stations are found in Appendix A.

During 2012, the total flow of Huntington Creek at the Huntington Plant was 7,967 acre feet. However, because of plant diversions, lake evaporation and the stored runoff at Electric Lake, adjusted flows of the Huntington Creek at Huntington Plant could increase approximately 25%. A comparison of runoff values for previous years has historically been presented in Table 10. However, because this data is no longer available, Table 10 is discontinued.

During 2012, water quality information on Huntington Creek near the Deer Creek confluence was compiled on a quarterly basis. Locations of water quality sampling stations monitored by PacifiCorp-Energy West Mining Company are listed below (refer to Map HM-1).

a. HCC01 - Above Power Plant Bridge
b. HCC02 - Below Deer Creek Confluence

c. HCC04 - Below Bridge @ Research Farm Bridge +
+ Not listed on map due to scale.

Specific water quality constituents analyzed are shown in Tables 11, 12, and 13. Values are in milligrams per liter unless otherwise noted. Raw data is on file at the Energy West Main Office. In general, the water shows a gradual increase in concentration of dissolved minerals as the flow proceeds down Huntington Canyon.

2. Deer Creek

Deer Creek is an ephemeral tributary of Huntington Creek and flows from the same canyon in which the Deer Creek Mine is located. PacifiCorp monitors the characteristics of Deer Creek according to the following flow and sampling schedule (see Hydrologic Monitoring Schedule Appendix K).

a. Flow and Sampling Schedule
   (1) Locations:
      (a) Above the Mine - DCR01
      (b) @ Permit Boundary - DCR04
      (c) Below the Mine - DCR06
         (See Map HM-1)
   (2) Flow: Information is collected during the first or second week of each month.
   (3) Water Quality Sampling:

Water samples will be collected and analyzed quarterly (one sample at low flow and high flow) during the first or second week of the quarter. Parameters analyzed are those listed in the DOGM Guidelines for Surface Water Operational Quality. (See Appendix K) The program was initiated in March 1988 and will continue through 2013 (i.e. sampling conducted in March, June, September, and December). Field measurements including pH, specific conductivity, and temperature will be performed in conjunction with quality measurements. Quantity will be monitored monthly.

b. Flow Information

As stated above, flow information is collected monthly throughout the year with the use of two Parshall flumes. (See Map HM-1 for flume locations.) A hydrograph showing all the data collected for 2012 and 1984-2011 has been generated for each location. (See Appendix B) The hydrographs show that consistant flows occurred in the Deer Creek drainage was the result mine water discharge from Deer Creek Mine. However, for 2012, no runoff occurred at DCR01 from May through October. The remaining months of the year found dry or frozen conditions. Flow at the lower two locations occurred throughout the year as the result of Deer Creek Mine discharge with peak flow (result from runoff) occurring in June (DCR04 – 3,504 gpm, DCR06 – 3,424 gpm).

c. Quality Information

In accordance with the Hydrologic Monitoring Plan, baseline quality analysis was performed in 2011. Baseline analysis is repeated once every five (5) years. The results of the historical operational quality analysis are listed in Tables 14 and 15. The minimum, maximum, and mean values are given for a five-year period along with the historical results. Values are in milligrams per liter unless otherwise noted. It is apparent from historical information in the tables that the quality of the Deer Creek runoff degrades slightly from the upper to the lower sampling point. The quality of the lower sampling point is thought to be affected by the Mancos Shale which outcrops above the lower sampling location. Raw data is on file at the Energy West Main Office.

3. Meetinghouse Canyon Creek

Meetinghouse Canyon Creek is an ephemeral tributary of Huntington Creek and is monitored according to the following schedule (see Hydrologic Monitoring Schedule in Appendix K).

a. Flow and Sampling Schedule
   (1) Location: South Fork of Meetinghouse Canyon (See Map HM-1)
   (2) Flow: Information is collected during the first or second week of each month.
   (3) Water Quality Sampling:

Water samples will be collected and analyzed quarterly (one sample at low flow and high flow) during the first or second week of the quarter. Parameters analyzed will be those stated in the DOGM Guidelines for Surface Water Operational Quality. (See AppendixK) The program was initiated in March 1984 and will continue through 2013, (i.e. sampling conducted in March, June, September, and December). Field measurements including pH, specific conductivity, and temperature will be performed monthly in conjunction with quality measurements. Quantity will be monitored monthly.

b. Flow Information

A hydrograph comparing 2012 and 1984-2011 can be found in Appendix C. For location MHC01, no flow occurred in both in the second and third quarters of 2012.

c. Quality Information

In accordance with the Hydrologic Monitoring Plan, baseline quality analysis was performed in 2011. Baseline analysis is repeated once every five (5) years. Quality sampling was initiated in 1986. When there is flow at location MHC01, Table 16 will list the minimum, maximum, and mean values along with historical results. Raw data is on file at the Energy West Main Office.

4. Mill Fork Canyon

Mill Fork Canyon is a tributary of Huntington Creek and was included in PacifiCorp's monitoring program starting in 1997. Monitoring of Mill Fork is conducted according to the following schedule (see Appendix K). Mill Fork Canyon is ephemeral from its headwaters to the western border of Section 21, Township 16 South, Range 7 East, and intermittent from that point to the confluence of Huntington Creek.

a. Flow and Sampling Schedule
   (1) Locations:
      (a) Above Mill Fork Fault – MFU03
      (b) Above Old Mines - MFA1
      (c) Mill Fork Canyon Culvert - MFB2
         (See Map HM-1)
   (2) Flow: Information is collected during the first or second week of each month.
   (3) Water Quality Sampling:

Water samples will be collected and analyzed quarterly (one sample at low flow and high flow) during the first or second week of the quarter. Parameters analyzed are those listed in the DOGM Guidelines for Surface Water Operational Quality. (See Appendix K) The program was initiated in 1997, and will continue through 2013 on a quarterly basis, i.e., March, June, September, and December. Field measurements, including pH, specific conductivity, and temperature will be performed quarterly in conjunction with quality measurements. Quantity will be monitored monthly.

b. Flow Information

Flow information is collected monthly throughout the year (See Map HM-1 for locations.) A hydrograph has been generated for each location. (See Appendix D) Locations MFU3, MFA1 and MFB2 did not flow in May through October 2012.

c. Quality Information

Historical monitoring data collected by Beaver Creek Coal Company - No. 4 Mine and the United States Geological Survey (site No. 76: Open File Report 81-539) has been incorporated in PacifiCorp's hydrologic database. Operational water quality monitoring was conducted during 1997 and 1998 (refer to the Quarterly Hydrologic submittals). Baseline quality analysis was initiated in November 1998 (2002 for MFU03). In accordance with the Hydrologic Monitoring Plan, baseline quality analysis was performed in 2011. Baseline analysis is repeated once every five (5) years.

Historical results of the samples collected are presented in Tables 17, 18 and 19. It is apparent from the data that the quality of the water degrades slightly from the upper reaches of Mill Fork, i.e., MFU3 to the mouth of the canyon, i.e., MFB2. Water quality has remained relatively consistent from year to year. (See Tables 17, 18 and 19). Raw data is on file at the Energy West Main Office.

5. Rilda Canyon Creek

Rilda Canyon Creek is a tributary of Huntington Creek and is monitored according to the following schedule (see Appendix K). Rilda Canyon Creek is ephemeral from its headwaters to the western border of Section 28, Township 16 South, Range 7 East, and perennial from that point to the confluence of Huntington Creek.

a. Flow and Sampling Schedule
   (1) Locations:
      (a) Right Fork of Rilda - RCF1*
      (b) Left Fork of Rilda - RCLF1**
      (c) Left Fork of Rilda - RCLF2**
      (d) Rilda Canyon - RCF2*
      (e) Rilda Canyon - RCF3
      (f) Rilda Canyon - RCW4 (See Map HM-1)

* During mining of the North Rilda leases, an additional site was added in 1999 upstream of RCF1 (adjacent to EM-163) to monitor surface/groundwater relationships. Flow will be measured yearly during base flow conditions.
** Flow and field parameters only.

   (2) Flow: Information is collected during the first or second week of each month.
   (3) Water Quality Sampling:

Water samples will be collected and analyzed quarterly (one sample at low flow and high flow) during the first or second week of the quarter. Parameters analyzed are those listed in the DOGM Guidelines for Surface Water Operational Quality. (See Appendix K) The program was initiated in June 1989 except for RCLF1 and RCLF2, which were initiated in 1990 and 1995, respectively, and will continue through 2012 on a quarterly basis, i.e., March, June, September, and December. Field measurements, including pH, specific conductivity, temperature, and dissolved oxygen, will be performed at the perennial stream locations, i.e., RCF3 and RCW4, monthly in conjunction with quality measurements. Quantity will be monitored monthly.

b. Flow Information

Flow information is collected monthly throughout the year with the use of three Parshall flumes and one V-notch weir. (See Map HM-1 for locations.) A hydrograph has been generated for each flume-weir location. (See Appendix E) Springs utilized by North Emery Water Users Special Services District (NEWUSSD) for culinary purposes are situated between monitoring locations RCF2 and RCF3. Flow above the spring area is ephemeral and below the stream is perennial. For location RCF1 flow occurred only during the months April through October with a peak flow estimated at 1,200 gpm in May. RCLF1 recorded no flow throughout the water year. Location RCLF2 recorded a flow of 4 gpm during the months of April. For location RCF2 flow occurred during the months of May and June with a peak flow estimated at 871 gpm in May. Below the spring area the stream is perennial and increases in flow from RCF3 to RCW4. During 2012 the peak flow for RCF3 was estimated at 735 gpm (May); for RCW4, 569 gpm (April). Baseline flow for 2012 at RCF3 and RCW4 was approximately 40 and 533 gpm, respectively. Data suggest that above the NEWUSSD springs the stream loses water to the alluvium and below the spring area the alluvium recharges the stream causing the flow to increase.

c. Quality Information

In accordance with the Hydrologic Monitoring Plan baseline quality analysis was performed in 2011. Baseline analysis is repeated once every five (5) years. Quality sampling was initiated in 1989; results of the samples collected are presented in Tables 20, 21, and 22. It is apparent from the data that the quality of the water degrades from the upper reaches of Rilda Canyon, i.e., RCF1, to the NEWUSSD spring area, and from that point to the mouth of the canyon, i.e., RCW4. Water quality has remained relatively consistent from year to year. (See Tables 20, 21, and 22) Raw data is on file at the Energy West Main Office.

B. Cottonwood Creek Drainage System

The southern portion of East Mountain and the entire Trail Mountain is intersected by Cottonwood Creek and its associated tributaries, including Cottonwood Canyon Creek and Grimes Wash. The Cottonwood Creek drainage is about equal in size to the Huntington drainage, with a total discharge from each of the drainages of about 70,000 acre feet per year. The major cultural feature on Cottonwood Creek is Joe's Valley Reservoir, located about twelve miles west of the town of Orangeville. The 63,000 acre foot reservoir was constructed by the U. S. Bureau of Reclamation and provides storage water for irrigation, industrial, and municipal needs in the Emery County area.

PacifiCorp monitors three of the tributaries of the Cottonwood Creek drainage system, Cottonwood Canyon Creek, Grimes Wash and Indian Creek. (See Maps HM-1 and MFS1851D)

1. Cottonwood Canyon Creek

Based on data collected by PacifiCorp, Cottonwood Canyon Creek is an ephemeral stream from its headwaters to Section 24, Township 17 South, Range 6 East and intermittent from that point to its confluence with Cottonwood Creek. The majority of water moving through Cottonwood Canyon Creek appears to be through the colluvial valley deposits. An extensive hydrogeologic investigation was conducted in Cottonwood Canyon Creek during 1992. Results can be found in Appendix C of the PAP. Four (4) permanent runoff sampling sites have been established along Cottonwood Canyon Creek and sampled as listed below. (See Hydrologic Monitoring Plan in Appendix K).

a. Flow and Sampling Schedule
   (1) Locations: (See Map HM-1)
      (a) Above Mine - SW-1
      (b) Below Mine - SW-2
      (c) @ USGS Flume - CCC01 (Flow and field parameters only)
      (d) Above Straight Canyon - SW-3
   (2) Flow: Information is collected during the first or second week of each month.
   (3) Water Quality Sampling:

Water samples will be collected and analyzed quarterly (one sample at low flow and high flow) during the first or second week of the quarter. Parameters analyzed will be those stated in the DOGM Guidelines for Surface Water Operational Quality. (See Appendix K) The program was initiated in December 1992 and will continue through 2013, i.e. March, June, September, and December. Field measurements including pH, specific conductivity, and temperature will be performed monthly in conjunction with quality measurements. Quantity will be monitored monthly.

b. Flow Information

As stated above, flow information is collected monthly throughout the year. (See Map HM-1 for flume locations.) A hydrograph for 2012 has been generated for each sampling location. (See Appendix F) The hydrographs show the intermittent nature of Cottonwood Canyon Creek. Flow at SW-1, continued from the previous water year and diminished in July. The peak flow occurred in May and recorded a flow of 14.7 gpm. Flow at SW-2 occurred from throughout the entire water year with a peak flow estimated at 32.2 gpm (May). Flow at SW-3 occurred in March, and July through September. Flows recorded at SW-2 and SW-3 are slightly influenced by discharge from the Cottonwood Mine (TMA001).

c. Quality Information

In accordance with the Hydrologic Monitoring Plan, baseline quality analysis was performed in 2011. Baseline analysis is repeated once every five (5) years. The results of the historical operational quality analysis are listed in Tables 23, 24, and 25. The minimum, maximum, and mean values are given for a five-year period along with the historical results. Values are in milligrams per liter unless otherwise noted. Raw data is on file at the Energy West Main Office.

The Cottonwood Canyon Creek drainage quality is influenced by the following factors: 1) A relatively high amount of suspended solids during spring runoff from Indian, Roans, Mill, and Marines canyons; 2) Alluvial/colluvial deposit recharge and discharge areas.

2. Grimes Wash

Grimes Wash is an ephemeral tributary of Cottonwood Creek and flows in the same canyon in which the Wilberg/Cottonwood Mine is located. Three permanent runoff sampling sites were established in 1980 and are sampled as listed below (see Hydrologic Monitoring Plan in Appendix K).

a. Flow and Sampling Schedule

(1) Locations: (See Map HM-1)
  (a) Right Fork - GWR01
  (b) Left Fork - GWR02
  (c) Below the Mine - GWR03

(2) Flow: Information is collected during the first or second week of each month.

(3) Water Quality Sampling:

Water samples will be collected and analyzed quarterly (one sample at low flow and high flow) during the first or second week of the quarter. Parameters analyzed will be those stated in the DOGM Guidelines for Surface Water Operational Quality. (See Appendix K) The program was initiated in March 1988 and will continue through 2012, i.e. March, June, September, and December. Field measurements including pH, specific conductivity, and temperature will be performed in conjunction with quality measurements. Quantity will be monitored monthly.

b. Flow Information

As stated above, flow information is collected monthly throughout the year with the use of two Parshall flumes. (See Map HM-1 for flume locations.) A hydrograph comparing 2012 to the data collected from 1984 through 2011 has been generated for each flume location. (See Appendix G) The Right and Left forks remained dry all year. Below the mine (GWR03), flow occurred in March and April with a peak of 1.35 gpm in March. Seeps or dampness at the Below the Mine location was noted throughout the remaining part of the year due to the influence of the springs emanating from the Starpoint Sandstone/Mancos Shale formational contact.

c. Quality Information

In accordance with the Hydrologic Monitoring Plan baseline quality analysis was performed in 2011. Baseline analysis is repeated once every five (5) years. The results of the 2011 operational quality analysis are listed in Tables 26, 27, and 28. The minimum, maximum, and mean values are given for a five-year period along with the historical results. Values are in milligrams per liter unless otherwise noted. Raw data is on file at the Energy West Main Office.

The Grimes Wash drainage quality is influenced by two factors: 1) Under normal conditions the Right Fork contributes a relatively high amount of suspended solids during spring runoff due to the fact that it is a south facing canyon dominated by argillaceous sediments; 2) Mancos Shale/Starpoint Sandstone interface seeps and springs elevate the TDS at the Below the Mine location.

3. Indian Creek

Indian Creek is a perennial tributary of the Cottonwood Creek and flows in Upper Joes Valley and merges with Lowry Water near the Joes Valley Reservoir. Four permanent runoff sampling sites were established in 2001 and are sampled as listed below (see Hydrologic Monitoring Plan in Appendix K).

a. Flow and Sampling Schedule
   (1) Locations: (See Map MFS1851D)
      (a) Above Camp Ground - ICA
      (b) Indian Creek Flume - ICF
      (c) Indian Creek Ditch - ICD
      (d) Below Cross-Over Road - ICB
   (2) Flow: Information is collected during base flow only (October)
   (3) Water Quality Sampling:

Water samples will be collected and analyzed during base flow monitoring. Parameters analyzed will be those stated in the DOGM Guidelines for Surface Water Operational Quality. (See Appendix K) The program was initiated in October 2001 and will continue through 2013. Field measurements including pH, specific conductivity, and temperature will be performed in conjunction with quality measurements.

b. Flow Information

As stated above, flow information is collected during base flow only with the use of portable 90° v-notch weir and one permanent Parshall flume. Flow occurred at all four locations with the highest flow (431 gpm) occurring at ICF. (See Map MFS1851D for monitoring locations.)

c. Quality Information

In accordance with the Hydrologic Monitoring Plan baseline quality analysis was performed in 2011. Baseline analysis is repeated once every five (5) years. The results of the 2012 operational quality analysis are tabulated in Appendix F. Values are in milligrams per liter unless otherwise noted. Raw data is on file at the Energy West Main Office.

IV. SPRINGS

A. East Mountain

Between the times where PacifiCorp began monitoring springs on East Mountain and 1986, the number of springs measured increased from less than fifty (50) to nearly eighty (80). PacifiCorp believed that more benefit could be realized by concentrating its monitoring to selective springs in the areas that was undermined within the following five years. (See Map HM-5) A meeting was held on March 25, 1987 with the U. S. Forest Service and the Utah State Division of Oil, Gas and Mining to determine the most effective plan for PacifiCorp's monitoring. A subsequent meeting was held on April 15, 1987 with the State Division of Oil, Gas and Mining to finalize the monitoring plan revisions. In addition to major revisions made in 1987, each year, State and Federal agencies are invited to participate in adjusting the monitoring schedule based on field investigations.

During the meetings it was resolved that the following springs will be monitored. Eight additional springs (denoted with a plus [+] symbol below) were added in 1989 after the annual field verification process jointly conducted by DOGM and PacifiCorp.

*	Burnt Tree Springs		79-40
*	Elk Spring (dev. in 2009)		80-41
*	Sheba Springs		80-43
	Ted's Tub	*	80-44
	79-2	*	80-46
*	79-10		80-47
	79-15	+	80-48
*	79-23		80-50
	79-24		82-51
*	79-26	*	82-52
+	79-28	*	84-56
*	79-29	+	89-60 (Alpine Spring)
	79-32	+	89-61 (developed in 2009)
	79-34	+	89-65
*	79-35	+	89-66
	79-38	+	89-67
		+	89-68

Of these springs, twelve will be monitored on a monthly basis, weather permitting, and have been denoted on the above list with asterisks (*).

Mill Fork Springs:

EM-216	EMPOND
GRANTS SPRING	LITTLE BEAR
JV-9	JV-34
MF-7	MF-10
MF-19B	MF-213
MF-219	MFR-10
MFR-30	RR-5
RR-15	RR-23A
SP1-26	SP1-29
UJV-101	UJV-206

1. Flow and Sampling Schedule

a. Flow

All springs on the preceding two lists are measured during the months of July and October. In addition, a minimum of twelve springs (southern end of East Mountain) are monitored to establish a discharge recession curve (denoted with an * above). Generally, measurements are made on a monthly basis during the months of July through October if weather and reasonable access permit; but when historical data indicate that a spring is short-lived, all efforts are made to measure discharge from that spring at least three times, equally spaced, within its flow period.

b. Quality Samples

All springs listed above are sampled for water quality characteristics during the months of July and October. Parameters analyzed are those listed in the DOGM Guidelines for Groundwater Operational Quality. (See Appendix K)

2. Spring Flow

Precipitation decreased considerably from 2011 to 2012 on East Mountain. Because of the lack of snowfall and rainfall throughout the water year, spring discharge rates responded with the East Mountain - Southern area, Mill Fork and Trail Mountain with appreciably decreased flows in 2012. Very dry conditions were realized throughout the region during 2012 water year that reported an average of only 74% of normal over the three monitoring sites. Temperature, a critical factor on spring discharge rates, was an overall 2.4 degrees higher (East Mountain Station) in 2012 than the historical averages. However, March through September experienced an average of 3.8 degrees higher than normal temperatures which probably increased evaporation rates which could have reduced recharge even more than reported.

Precipitation received at East Mountain weather station and spring discharge rates set an all time low for the 2002 water year and only improved slightly in 2003 and 2004. Table 29, is a tabulation of the flow data collected during the 2012 monitoring season. To record the season variation, all springs measured in July are measured again in October. The seasonal variation is represented in Table 29, under the column heading "Seasonal Net Change." The percentage figures represent the amount of change, either positive or negative. The average change reveals a thirty-nine percent (39%) [sixty-five percent (65%) by volume] decrease from the July to the October measurements for Southern East Mountain and a seven percent (7%) [eighteen percent (18%) by volume] decrease from the July to the October measurements for the Mill Fork Area. The resulting factor influencing this decrease was the fact that warmer than normal temperatures occurred during March and April in the upper elevation which melted much of the snowpack affecting recharge.

A twenty-nine year comparison of spring discharge is shown in Table 30. The table includes a year by year comparison of springs identified from each mode of occurrence (Table 31). The springs utilized in the comparison are underlined in Table 31. The flow values for the individual springs represent the July measurements. October measurements were not utilized because winter weather conditions caused some springs to become inaccessible.

Table 30 has been compared to East Mountain climatology to see how closely spring discharge rates follow local annual precipitation. Figure 3 reveals good correlation between spring discharge and precipitation. Along with precipitation, temperature plays a critical role in yearly discharge variations, especially during the early stages of the runoff period. Listed in Table 32 is a comparison of January through June temperature data from surrounding weather stations for the period 1982-2012 versus departure from normal. The comparison is vital in determining mining effects on spring discharge versus general changes in annual precipitation.

Table 32 clearly demonstrates near average temperatures between 1982 and 1984, but starting in 1985 and continuing through 2000 (except for 1991 and 2001) positive departure from normal has been significant. However, in 2012 temperatures averaged -4.61 degrees departure from the normal. Comparison between spring discharge rate and general changes in annual precipitation patterns correlated well in the past due to abnormal temperatures experienced during the early runoff period (January through June). Figure 3 not only includes a comparison of spring discharge rate and precipitation as in the past, but also temperature departure due to the critical influence temperature has on peak discharge occurrence.

An additional flow information study was initiated during the summer of 1985. The purpose of the program was to establish flow recession curves for the following springs: (1) Burnt Tree, (2) Elk Springs (developed in 2009), (3) Sheba, (4) 79-10, (5) 79-23, (6) 79-26, (7) 79-29, (8) 79-35, (9) 80-44, (10) 80-46, (11) 82-52, (12) 84-56. The flow information collected during 2012 is shown in Table 33; corresponding spring recession curves comparing 2012 to historical values are located in Appendix H.

3. Quality

TABLE 1: PRECIPITATION IN EMERY COUNTY, UTAH (2012 Water Year)

	Castle Dale* (Elev. 5800')		Huntington Plant (Elev. 6500')		East Mountain (Elev. 8985')	
	Precip. (inches)	*% of Normal*	*Precip. (inches)*	*% of Normal*	*Precip. (inches)*	*% of Normal*
2011						
October	0.39	46	3.2	267	0.86	66
November	0.19	38	0.59	98	0.59	60
December	0.78	140	0.14	22	0.53	59
2012						
January	0.47	73	0.19	23	0.75	67
February	0.56	96	0.35	50	0.95	77
March	0.00	0	0.59	83	0.65	52

NOTE: *Climatic Station was moved from a point one mile above the dam site to a point 500 feet below dam site on November 15, 1973.*
October, November, and December 70-71 were estimated by correlation with Clear Creek Weather Station.

* No Precipitation data was collected from Electric Lake site.

** Historical Average. Does not include current report year.

HYDROLOGIC MONITORING PROGRAM
DEER CREEK, WILBERG/COTTONWOOD, DES-BEE-DOVE and TRAIL MOUNTAIN MINES

I. MONITORING LOCATIONS

A. Surface Water Hydrology (for maps refer to Deer Creek, Wilberg/Cottonwood, Des-Bee-Dove Mine: Volume 9 Map HM-1, Deer Creek Volume 12 R645-301-700: Hydrologic Monitoring Map MFS1851D Mill Fork Lease for East Mountain locations listed below / Trail Mountain Mine: Volume 3 Plate 7-1 and Plate 7-2 for Trail Mountain locations listed below)

1. Cottonwood Creek Drainage System

a. ***Cottonwood Canyon Creek*** (refer to Deer Creek, Wilberg/Cottonwood, Des-Bee-Dove Mine: Volume 9 Map HM-1 or Trail Mountain Mine Permit Volume 3 Plate 7-1)

(1) SW-1 - Above Trail Mtn. Mine
(Approximately 5000 feet upstream from the inlet culvert for the disturbed area.) 2150 feet South, 2000 feet East of the Northwest corner of Section 24, Township 17 South, Range 6 East.

(2) SW-2 - Below Trail Mtn. Mine
(Approximately 200 feet downstream from the outlet culvert for the disturbed area.) 1300 feet South, 1750 feet West of the Northeast corner of Section 25, Township 17 South, Range 6 East.

(3) CCC01 - USGS Flume:
(Approximately 7800 feet downstream from the outlet culvert for the disturbed area.)1500 feet North, 200 feet East of the Southwest corner of Section 31, Township 17 South, Range 7 East.

(4) SW-3 - Below Trail Mtn. Mine
(Approximately 3800 feet above confluence with Straight Canyon) 2400 feet South, 2400 feet East of the Northeast corner of Section 6, Township 18 South, Range 6 East.

b. ***Unnamed Drainage off Straight Canyon*** (refer to Trail Mountain Mine Permit Volume 3 Plate 7-1)

(1) T-19
(Approximately 200 feet upstream from the from confluence with Straight Canyon) 2500 feet South, 1100 feet East of the Northeast corner of Section 3, Township 18 South, Range 6 East.

c. ***Grimes Wash*** (refer to Deer Creek, Wilberg/Cottonwood, Des-Bee-Dove Mine: Volume 9 Map HM-1)

(1) GWR01 - Right Fork:
(Approximately 1500 feet upstream of the inlet culvert for the disturbed area.) 550 feet North, 1500 feet West of the Southwest corner of Section 22, Township 17 South, Range 7 East.

(2) GWR02 - Left Fork:
(Approximately 50 feet upstream of the inlet culvert for the disturbed area.) 200 feet South, 2350 feet East of the Northwest corner of Section 27, Township 17 South, Range 7 East.

(3) GWR03 - Below the mine:
(Approximately 500 feet downstream of the outlet culvert below the disturbed area.) 1770 feet South, 1820 feet West of the Northeast corner of Section 27, Township 17 South, Range 7 East.

d. ***Indian Creek*** (refer to Deer Creek Volume 12 R645-301-700: Hydrologic Monitoring Map MFS1851D)

(1) ICA - Indian Creek Above
(Approximately 2500 feet northwest of the Mill Fork permit boundary) 400 feet North, 2350 feet West of the Southwest corner of Section 3, Township 16 South, Range 6 East.

(2) ICF - Indian Creek Flume
(Approximately 2100 feet west of the Mill Fork permit boundary) 300 feet North, 3400 feet West of the Southwest corner of Section 10, Township 16 South, Range 6 East.

(3) ICD - Indian Creek Ditch
(Approximately 1600 feet west of the Mill Fork permit boundary, irrigation ditch for Upper Joes Valley) 240 feet North, 2850 feet West of the Southwest corner of Section 15, Township 16 South, Range 6 East.

(4) ICB - Indian Creek Below
(Approximately 3700 feet west of the Mill Fork permit boundary, junction of Indian Creek and FDR040) 70 feet North, 120 feet West of the Southwest corner of Section 16, Township 16 South, Range 6 East.

2. Huntington Creek Drainage System

a. ***Huntington Creek*** (refer to Deer Creek, Wilberg/Cottonwood, Des-Bee-Dove Mine: Volume 9 Map HM-1)

(1) HCC01 - Above Deer Creek Confluence:
1400 feet north, 2200 feet west of the southeast corner of Section 36, Township 16 South, Range 7 East.

(2) HCC02 - Below Deer Creek Confluence:
300 feet north, 300 feet west of the southwest corner of Section 31, Township 16 South, Range 8 East.

(3) HCC04 - @ Research Farm*
800 feet north, 200 feet east of the southwest corner of Section 5, Township 17 South, Range 8 East.
*Not listed on map due to scale.

b. ***Deer Creek*** (refer to Deer Creek, Wilberg/Cottonwood, Des-Bee-Dove Mine: Volume 9 Map HM-1)

(1) DCR01 - Above the mine:
(Approximately 600 feet upstream from the mine facility.) 200 feet North, 800 feet West of the

Southeast corner of Section 10, Township 17 South, Range 7 East.

(2) DCR04 - Near C1/C2 Belt Intersection: (Approximately 5,000 feet downstream from the mine facility.) 300 feet North, 2000 feet East of the Southeast corner of Section 2, Township 17 South, Range 7 East.

(3) DCR06 - @ Huntington Creek Confluence: (Approximately 15,000 feet downstream from the facility) 1400 feet north, 1100 feet east of the southeast corner of Section 6, Township 16 South, Range 7 East.

c. ***Meetinghouse Canyon - South Fork*** (refer to Deer Creek, Wilberg/Cottonwood, Des-Bee-Dove Mine: Volume 9 Map HM-1)

(1) MHC01 - Meetinghouse Canyon South Fork (Approximately 200 feet upstream from the north and south convergence.) 800 feet North, 1500 feet East of the Southwest corner of Section 35, Township 16 South, Range 7 East.

d. ***Rilda Canyon*** (refer to Deer Creek, Wilberg/Cottonwood, Des-Bee-Dove Mine: Volume 9 Map HM-1)

(1) RCF-1 - Rilda Canyon - Right Fork: (Approximately 4000 feet upstream from the Right and Left fork convergence.) 400 feet South, 200 feet West of the Northeast corner of Section 30, Township 16 South, Range 7 East.

(2) RCLF1 - Rilda Canyon - Left Fork, below Rilda Canyon Portals: (Approximately 200 feet upstream from the Right and Left fork convergence.) 2400 feet North, 2100 feet West of the Southeast corner of Section 29, Township 16 South, Range 7 East.

(3) RCLF2 - Rilda Canyon - Left Fork, above Rilda Canyon Portals: (Approximately 1600 feet upstream from the Right and Left fork convergence.) 1600 feet North, 2300 feet West of the Southwest corner of Section 29, Township 16 South, Range 7 East.

(4) RCF2 - Rilda Canyon - Above NEWUSSD springs: 2500 feet South, 400 feet West of the Northeast corner of Section 29, Township 16 South, Range 7 East.

(5) RCF3 - Rilda Canyon - Below NEWUSSD springs: 2550 feet South, 1000 feet East of the Northeast corner of Section 28, Township 16 South, Range 7 East.

(6) RCW4 - Rilda Canyon: (Approximately 1000 feet upstream from the confluence with Huntington Creek.) 850 feet North, 1900 feet West of the Southeast corner of Section 26, Township 16 South, Range 7 East.

e. ***Mill Fork Canyon*** (refer to Deer Creek Volume 12 R645-301-700: Hydrologic Monitoring Map MFS1851D)

(1) MFA01 - Mill Fork Canyon - Above Old Mine: (Approximately 2000 feet above old mine portals @ end of USFS development road.) 100 feet North, 1500 feet West of the Southeast corner of Section 17, Township 16 South, Range 7 East.

(2) MFB02 - Mill Fork Canyon - Above Huntington Creek Confluence: (Approximately 200 feet above confluence with Huntington Creek @ culvert outfall.) 100 feet South, 1900 feet East of the Northwest corner of Section 22, Township 16 South, Range 7 East.

(3) MFU03 - Mill Fork Canyon - Above Mill Fork Fault Crossing: (Approximately 700 feet upstream of projected Mill Fork Fault crossing) 1150 feet North, 1700 feet East of the Southwest corner of Section 17, Township 16 South, Range 7 East.

3. **Reclamation Monitoring:** Following final reclamation, backfilling and grading monitoring will be conducted at points immediately above and below the reclaimed site.

B. Groundwater Hydrology

1. **East Mountain Springs** (refer to Deer Creek, Wilberg/Cottonwood, Des-Bee-Dove Mine Permit : Volume 9 maps HM-4 and HM-5)

b. Underground: In-Mine

(1) Deer Creek Mine (Refer to Annual Hydrologic Reports for Locations : Map HM-2)

5. **In-Mine Water Locations**

a. Deer Creek Mine (Refer to Annual Hydrologic Reports for Locations : Map HM-2)

b. Wilberg/Cottonwood Mines (Refer to Annual Hydrologic Reports for Locations : Map HM-3)

c. Trail Mountain Mine (Refer to Annual Hydrologic Reports for Locations : PLATE 7-3)

6. **Waste Rock Wells** (refer to Deer Creek, Wilberg/Cottonwood, Des-Bee-Dove Mine: Volume 9 Map HM-1)

a. Deer Creek
b. Cottonwood

C. UPDES Monitoring Locations

a. ***Deer Creek Mine***
UPDES UT0023604
001- Sediment Pond
002- Mine Discharge

b. ***Wilberg/Cottonwood Mines***
UPDES UT0022896
001- Mine Discharge @ Cottonwood Canyon (TMA)
003- Sediment Pond @ Mine Facilities
005- Sediment Pond Discharge @ Waste Rock Site

d. ***Trail Mountain Mine***
UPDES UT0023728
001- Sediment Pond
002- Mine Discharge

II. MONITORING SCHEDULE (see enclosed monitoring schedules for operational, baseline, and reclamation monitoring)

A. Field Measurements

Field Measurements collected during quality sampling: Listed below are the sites which will be monitored by PacifiCorp - Energy West in accordance with the guidelines established by DOGM; i.e.

- Date and Time
- Flow
- pH
- Temperature
- Conductivity
- Dissolved oxygen (perennial streams only)

Surface Monitoring

Surface monitoring locations will be field monitored quarterly for all field parameters, except Indian Creek - monitoring to be conducted during baseflow only.

1. Cottonwood Canyon Creek

a. Cottonwood Canyon Creek

(1) SW-1
(2) SW-2
(3) CCC01 - USGS Flume
(4) SW-3

b. Grimes Wash

(1) GWR01
(2) GWR02
(3) GWR03

c. Indian Creek

(1) ICA
(2) ICF
(3) ICD
(4) ICB

d. Straight Canyon

(1) T-19 (Unnamed Side Drainage)

2. Huntington Canyon Drainage

a. Deer Creek

(1) DCR01
(2) DCR04
(3) DCR06

b. Huntington Creek

(1) HCC01
(2) HCC02
(3) HCC04

Flow in Huntington Creek is measured only at HCC01 by Utah Power, and will be reported in the Annual Hydrologic Report.

c. Meetinghouse Canyon - South Fork:

(1) MCH01

d. Rilda Canyon

(1) RCF1*
(2) RCLF 1
(3) RCLF 2
(4) RCF2
(5) RCF3
(6) RCW4

* Baseline flow will be measured adjacent to EM-163

e. Mill Fork Canyon

(1) MFA01
(2) MFB02
(3) MFU03

PACIFICORP
ENERGY WEST
HYDROLOGIC MONITORING PROGRAM
DEER CREEK, WILBERG/COTTONWOOD, DES-BEE-DOVE and TRAIL MOUNTAIN MINES

Groundwater Monitoring

1. East Mountain Springs (see monitoring location list I.B.1)

2. Trail Mountain Springs (see monitoring location list I.B.2)

3. East Mountain Springs - Mill Fork Area (see monitoring location list I.B.3)

   East/Trail Mountain Springs will be field monitored during the months of July and October. In addition, the East Mountain Recession Study Springs (denoted by asterisks in the Monitoring Location section) and Trail Mountain Springs will be field monitored for flow only from July through October. T-18: Oliphant Mine Discharge will be collected and analyzed quarterly. Rilda Canyon Springs - (NEWUSSD: Meters 2 & 3; when functioning) will be field monitored monthly depending upon access.

4. In-Mine

   a. Deer Creek
   b. Wilberg/Cottonwood
   c. Trail Mountain

   In-mine locations will be field monitored quarterly for all field parameters except pH, conductivity, and dissolved oxygen.

5. Piezometric Wells

   a. Surface

      Piezometric surface wells will be field monitored for level only on a monthly basis depending upon access.

      (1) Rilda Canyon (see Map HM-1 for locations)

         P1
         P5
         P6
         P7
         EM-47

(2) Cottonwood Canyon Creek (see Map HM-1 for locations)

EM-31

CCCW-1S
CCCW-2A
CCCW-3A
CCCW-3S U
CCCW-3S L
TM-1B
TM-3

6. Waste Rock Wells

a. Deer Creek
b. Cottonwood

UPDES Monitoring

1. Deer Creek
2. Wilberg/Cottonwood
3. Trail Mountain

UPDES sites will be monitored as specified in the individual permits.

Reclamation Monitoring

Surface Water Resources: (see enclosed summary of operational, baseline, and reclamation monitoring schedules)
Surface monitoring locations will be field monitored monthly for flow and all field parameters quarterly until bond release.

Ground Water Resources: (see enclosed summary of operational, baseline, and reclamation monitoring schedules)

Springs East/Trail Mountain Springs will be field monitored during the months of July and October.

Rilda Canyon Springs (NEWUSSD: Meters 2 & 3; when functioning)) will be field monitored monthly for flow depending upon access. East/Trail Mountain Springs (including Rilda

Springs and T-18 [Oliphant Mine]) monitoring will be conducted until permit area reduction approval or unless otherwise approved by the Division.

Wells: Piezometric surface wells (Rilda Canyon and Cottonwood Canyon including TM-3 in Straight Canyon): will be field monitored for level only on a monthly basis depending upon access. Piezometric surface well monitoring will be conducted until permit area reduction approval or unless otherwise approved by the Division.

Waste Rock Wells and TM-1B: will be field monitored for level only on a quarterly basis. Monitoring will be conducted until sealing during final reclamation.

UPDES: Sites will be monitored as specified in the individual permits

B. **Quality Sampling** (Laboratory Measurements)

a. **Surface Water Hydrology:** Water samples will be collected and analyzed quarterly (one sample at low flow and high flow) during the first or second week of the quarter, except for Indian Creek - quality samples will be collected during baseflow only. Parameters analyzed are those listed in the DOGM Guidelines for Surface Water Quality (see Table 1-Surface Water Quality Parameter List). Quarterly sampling was initiated during March 1988 and will continue throughout the year; i.e., June, September, and December. Baseline analysis was performed in 2001 and will be repeated every five years there-after.

a. Cottonwood Creek Drainage

(1) Cottonwood Canyon Creek

(a) SW-1
(b) SW-2
(c) SW-3

(2) Grimes Wash

(a) GWR01
(b) GWR02

(c) GWR03

(3) Indian Creek

(a) ICA
(b) ICD
(c) ICB

(4) Straight Canyon

(a) T-19

b. Huntington Creek Drainage

(1) Deer Creek

(a) DCR01
(b) DCR04
(c) DCR06

(2) Huntington Creek

(a) HCC01
(b) HCC02
(c) HCC04

(3) Meetinghouse Canyon - South Fork:

(a) MCH01

(5) Rilda Canyon

(a) RCF1
(b) RCF3
(c) RCW4

(6) Mill Fork Canyon

(a) MFA01
(b) MFB02

(c) MFU03

Reclamation Monitoring - Surface Water Hydrology: Water samples will be collected and analyzed quarterly (one sample at low flow and high flow) during the first or second week of the quarter. Parameters analyzed are those listed in the DOGM Guidelines for Surface Water Quality (see Table 1-Surface Water Quality Parameter List). Sampling will be conducted on a quarterly basis until bond release. Baseline analysis will be performed on the 5th and 9th years following reclamation. In no case will baseline sampling time frame exceed 5 years converting from operational to reclamation monitoring.

2. **Groundwater Hydrology**

a. East/Trail Mountain Springs: Water samples will be collected and analyzed during the months of July and October. Rilda Canyon Springs (NEWUSSD: Meters 2 & 3; when functioning) and T-18 (Oliphant Mine Discharge) will be monitored for quarterly for quality. Parameters analyzed are those listed in the DOGM Guidelines for Groundwater Water Quality (see Table 2-Ground Water Quality Parameter List).

b. In-Mine: Two water samples will be collected and analyzed per mine quarterly. Parameters analyzed are those listed in the DOGM Guidelines for Groundwater Water Quality (see Table 2-Ground Water Quality Parameter List).

c. Wells: TM-1B will be sampled quarterly. Parameters analyzed are those listed in the DOGM Guidelines for Groundwater Water Quality (see Table 2-Ground Water Quality Parameter List).

d. Waste Rock Wells: One water sample will be collected and analyzed per location quarterly. Parameters analyzed are those listed in the DOGM Guidelines for Groundwater Water Quality (see Table 2-Ground Water Quality Parameter List).

Baseline analysis was performed in 2001 and will be repeated every five years thereafter.

Reclamation Monitoring - Groundwater Hydrology:

a. East/Trail Mountain Springs: Water samples will be collected and analyzed during the months of July and October. Rilda Canyon Springs

(NEWUSSD: Meters 2 & 3; when functioning) will be monitored quarterly for quality. Parameters analyzed are those listed in the DOGM Guidelines for Groundwater Water Quality (see Table 2-Ground Water Quality Parameter List). East/Trail Mountain Springs (including Rilda Springs and T-18 [Oliphant Mine Discharge]) monitoring will be conducted until permit area reduction approval or unless otherwise approved by the Division.

b. In-Mine: Two water samples will be collected and analyzed per mine quarterly until the mine is sealed or the sites become inaccessible. Parameters analyzed are those listed in the DOGM Guidelines for Groundwater Water Quality (see Table 2-Ground Water Quality Parameter List).

c. Wells: Well TM-1B will be sealed during final reclamation. Quarterly sampling will continue until sealing. Parameters analyzed are those listed in the DOGM Guidelines for Groundwater Water Quality (see Table 2-Ground Water Quality Parameter List).

d. Waste Rock Wells: Waste rock wells will be sealed during final reclamation. One water sample will be collected and analyzed per location quarterly until well sealing. Parameters analyzed are those listed in the DOGM Guidelines for Groundwater Water Quality (see Table 2-Ground Water Quality Parameter List).

e. Post Reclamation Monitoring: PacifiCorp commits to conduct annual surveys to identify new discharge locations within and below sealed portals. If discharge occurs, one water sample will be collected and analyzed per location quarterly. Parameters analyzed are those listed in the DOGM Guidelines for Groundwater Water Quality (see Table 2-Ground Water Quality Parameter List). Baseline analysis will be performed on the 5^{th} and 9^{th} year.

3. UPDES Monitoring Sites

a. Deer Creek Mine
b. Wilberg/Cottonwood Mines
c. Trail Mountain Mine

UPDES sites will be monitored as specified in the individual permits.

III. ANNUAL REPORTS

All data collected regarding the hydrology of East/Trail Mountain will be summarized by the applicant in an annual Hydrologic Monitoring Report. Copies of the report will be submitted to the Utah State Division of Oil, Gas and Mining. In addition, any raw data collected will be submitted to the Utah State Division of Oil, Gas and Mining on a quarterly basis.
