2. Signs and Markers

Mine identification signs were observed at the Waste Rock Site, Main Facilities and at Rilda Facilities. All three signs contained the required information.

4.a Hydrologic Balance: Diversions

A culvert inlet along side of the access road to the Rilda Pad has tumble weeds in front of the opening. The weeds need to be removed to prevent a substantial blockage.

4.b Hydrologic Balance: Sediment Ponds and Impoundments

The sediment ponds at the Waste Rock Site, Main Facility and Rilda Facility were viewed during the inspection. The Main Facility sediment pond is the only pond that contained water. All ponds appeared stable.

7. Coal Mine Waste, Refuse Piles, Impoundments

It appears as if new material has been placed on cell a or the northern cell. The cell from the last certified inspection was nearing its designed capacity. The pile will need to be surveyed to determine if it is now at capacity. The refuse pile appeared stable. No visible hazards were observed.

8. Noncoal Waste

Noncoal waste was observed in various locations at the Main Facility. The locations ranged from the access road, storage areas, parking area, portal area, the diversion and three inlets on the incline of the road into the parking area. This has been an area of concern in the past and has been cited numerous times. The trash needs to be gathered and disposed of properly. Elizabeth Shaeffer noted that the approved noncoal waste storage area is less than desirable and probably adds to the constant and reoccurring noncoal waste problems. No action was taken at this time but future infractions will need to be addressed by enforcement action.

18. Support Facilities, Utility Installations

Sections of the corrugated metal cover over the conveyor belt line have come loose and are laying on the ground. They were observed at approximately inverted U #52 on the C2 belt line (Offside) and adjacent to the C1 belt line toward the inlet side of the sediment pond (Roadside).
